

Metal Disclaimer

The metal (14 gauge) is non-primed steel. Each metal bunny may have color variations and could show signs of surface rust. If left untreated the metal will change over time – severity of rusting will depend on where it is displayed and how it is stored. If this look is not desired follow the steps below.

To paint the metal use a wire brush/grinder wheel to remove the surface rust and then use a primer (i.e., Rust-Oleum). Once primed apply any paint of choice. To display outside will require outdoor paint and/or a polyurethane sealant.

The metal bunnies that are sold as painted on one side are chalk painted with three coats and have a clear sealant. However, since a primer was not used there may be signs of rust coming through in various patterns over time. If this look is not desired it can be modified by removing the paint and following the above steps.

Handling the metal may cause grey/black residue on your hands and could transfer onto clothing or other materials.
