3600W INVERTER GENERATOR
WITH PURE SINE WAVE

https://help.tools/
Read all safety warnings and all instructions thoroughly before operating this product.
Ensure you keep your manual in a safe place for future reference.

IM Ed2 04/2019
QR codes take you where you want to go quickly and easily

Whether you require product information, spare parts or accessories, details on warranties or after-sales service, or if you want to watch a product demonstration video, our QR codes will take you there in no time at all.

What is a QR code?
A QR-code (QR=Quick Response) is a type of matrix that can be read with a smartphone camera and that contains a link to a website or contact details, for example.

Advantage: You are not required to manually enter a website address or contact details.

How it works
To scan the QR code, all you need is a smartphone with QR codes reader software and an Internet connection*. This type of software can be downloaded for free from your smartphone’s app store.

Try it out now
Just scan the QR code with your smartphone and find out more about the Aldi product you have purchased*.

* Depending on your tariff you may be charged for the connection.
Congratulations on the purchase of your Workzone® Titanium 3600W Inverter Generator with Pure Sine Wave. When you open your packaging, first remove all items and check there are no parts damaged or missing. If you find anything wrong, do not operate the product until the parts have been replaced or the fault has been rectified. Failure to do so could result in serious personal injury.

**NOTE:** This is a 4 stroke Inverter Generator.
The engine MUST be filled with 600ml of SAE 10W-30 **BEFORE** starting. Fresh unleaded fuel must be used in this unit. Do NOT use Ethanol based fuels. Do NOT mix oil with fuel.

**NOTE:** First time users or inexperienced operators pay particular attention to the operation of the Generator, including details of starting and stopping and correct use of the Generator on pages 19-23, as well as the maintenance instructions on pages 26-31.

**Intended use of the 3600W Inverter Generator with Pure Sine Wave**
It is not suitable for trade or commercial use.
This product is suited for home, camping, caravan applications and domestic household mains failure back up. It will allow you to power outdoor lights, power tools, home appliances including sensitive electronic equipment, including televisions and computers.

**NOTE:** For sensitive equipment like computers, sound systems, televisions, microwaves etc, it is highly recommended to have a surge protector connected to the generator.

**NOTE:** This petrol Generator is NOT suitable for:
* Marine applications, and should never be used on board water craft
* Continuous off the grid power

**Contents of carton**
1 x 3600W Inverter Generator
1 x Instruction Manual
1 x Warranty Card & details
1 x Quick Start Guide
1 x 10mm Tube Spanner
1 x 21mm Spark Plug Tube Spanner
1 x Multi Size Spanner
1 x Double Ended Screwdriver (Phillips and flat)
2 x Wheels (+ 2 x assembly bolts, nuts, spring washer & flat washer)
4 x Feet (+ 4 x assembly hex head screws, nuts, spring washer & flat washer)
1 x Wheel Foot (+ 1 x assembly hex head screw)
1 x Handle Assembly (+ 2 x assembly screws & nyloc nuts)

The rating plate on your Inverter Generator may show symbols. These represent important information about the product or instructions on its use.

- **Conforms to relevant standards for electrical safety and electromagnetic compatibility.**
- **Wear hearing protection. Wear eye protection.**
- **Wear breathing protection.**
- **Wear safety footwear.**
- **Wear safety gloves.**
- **Fuel Tap (direction of operation).**
- **240V.a.c AC Outlet.**
- **Warning.**
- **Read these instructions for use carefully.**
- **Low Oil Indicator.**
- **Load Status indicator. (Refer to the instruction manual for advice) **
- **Power Supply indicator.**
- **Never use in the home or in partly enclosed areas such as a garages.**
- **Exhaust contains carbon monoxide, a poisonous gas you cannot see or smell.**
- **Explosive material.**
- **Do not operate in a hazardous location such as areas where there is a risk of explosion of petrol fumes, leaking gas or explosive dust.**
- **Extremely hot surface. Do not touch a hot muffler, gear box or cylinder, you may get burned. These parts get extremely hot from operation and remain hot for a short time after the unit is turned off.**
- **Choke Control.**
- **Maintain a safe distance.**
General safety warnings

WARNING! Read all safety warnings and all instructions. Failure to follow the warnings and instructions may result in fire and/or serious injury.

The word power tool used in the following warnings and throughout this manual refers to petrol driven power tools and Generators. This unit may not be used by people (including children) with reduced physical, sensory or mental capacities, with a lack of experience and without the appropriate knowledge, unless they are supervised by someone who is responsible for their safety or have been instructed by such a person with regard to how the unit is to be operated. Children should be supervised to ensure that they do not play with the device.

Non-skilled persons and first time users should read and understand the full instruction manual before proceeding with use of the product or recommended maintenance tasks.

Save all warnings and instructions for future reference

1. Work area safety
   a. Keep work area clean and well lit. Cluttered or dark areas invite accidents. Rags, cloths, cord, string and similar items should never be left around the work area.
   b. Do not operate power tools in explosive environments, such as in the presence of flammable liquids, gases, or dust. Power tools create sparks, which may ignite the dust or fumes.
   c. Keep children and bystanders away while operating a power tool. Distractions can cause the operator to lose control.

2. Personal safety
   a. Stay alert, watch what you are doing and use common sense when operating a power tool. Do not use a power tool while you are tired or under the influence of drugs, alcohol or medication. A moment of inattention while operating power tools may result in serious personal injury.
   b. Use personal protective equipment. Always wear eye protection. Protective equipment such as dust mask, non-skid safety shoes, hard hat, or hearing protection will reduce personal injuries.

   c. Prevent unintentional starting. Ensure the switch is in the “off” position when starting, picking up or carrying the tool. Carrying power tools with your finger on the switch or energising power tools that have the switch on invites accidents.
   d. Remove any adjusting key or wrench before turning the power tool on. A wrench or key left attached to a rotating part of the power tool may result in personal injuries.
   e. Do not overreach. Keep proper footing and balance at all times. This enables better control of the power tool in unexpected situations.
   f. Dress properly. Do not wear loose clothing or jewellery. Keep your hair, clothing and gloves away from moving parts. Loose clothes, jewellery or long hair can be caught in moving parts.
   g. If devices are provided for the connection of dust extraction and collection facilities, ensure these are connected and properly used. Use of dust collection can reduce dust-related hazards.

3. Product use and care
   a. Do not force the product. Use the correct product for your application. The correct product will do the job better and safer at the rate for which it was designed.
   b. Do not use the product if the switch does not turn it “on” and “off”. Any product that cannot be controlled with the switch is dangerous and must be repaired.
   c. Ensure the product is switched off before making any adjustments, changing accessories, or storing the product. Such preventive safety measures reduce the risk of starting the product accidentally.
   d. Store idle products out of the reach of children and do not allow persons unfamiliar with the product or these instructions to operate the product. Generators are dangerous in the hands of untrained users.
   e. Maintain products with care. Check for misalignment or binding of moving parts, breakage of parts and any other condition that may affect the product’s operation. If damaged, have the power tool repaired before use. Many accidents are caused by poorly maintained products.
   f. Keep cutting tools sharp and clean. Properly maintained cutting tools with sharp cutting edges are less likely to bind and are easier to control.
   g. Use the product, accessories and tool bits etc. in accordance with these instructions, taking into account the working conditions and the work to be performed. Use of the product for operations different from those intended could result in a hazardous situation.
Additional Safety Rules for Petrol Products

Additional Safety Rules for Generators

• The generator is supplied with lifting handles on each side of the generator, and when lifting, two operators should lift the generator together.
• The generator can also be fitted with wheels, and if these are fitted, the generator can be moved with the additional front lifting handle by one person.
• DO NOT OPERATE IN A HAZARDOUS LOCATION. SUCH AREAS INCLUDE WHERE THERE IS A RISK OF EXPLOSION OF PETROL FUMES, LEAKING GAS OR EXPLOSIVE DUST.
• DO NOT OPERATE IN A CONFINED AREA. EXHAUST GASES, SMOKE OR FUMES COULD REACH DANGEROUS CONCENTRATIONS.
• THE OUTPUT OF THIS GENERATOR IS POTENTIALLY LETHAL. THE GENERATOR SHOULD NOT BE CONNECTED TO A FIXED ELECTRICAL INSTALLATION EXCEPT BY AN APPROPRIATELY LICENSED PERSON.
• Protect your generator. This generator is NOT WEATHERPROOF and should not be exposed to direct sunlight, high ambient temperature and damp, wet or high humidity conditions.
• Do not smoke while refuelling. This is potentially dangerous as it may ignite the fuel and cause an explosion.
• Take care not to spill fuel. When refuelling the generator ensure that the motor has been switched off. Prevent the spilling of fuel as this may also ignite with the hot motor. Never refuel whilst the engine running.
• Be careful where you store the generator. Store the generator in a dry area away from inflammable liquids.
• Keep your distance. The generator emits exhaust fumes. As a safety precaution do not stand close to the unit whilst it is in operation. Ensure bystanders also keep their distance.
• Locate the generator for use in a convenient place so as to use the shortest extension lead as possible, but still sufficiently away from the exhaust fumes.
• Ensure the generator has oil. Before commencing the generator, ensure that the unit has been filled with SAE 10W-30 4 stroke oil.
• Any extension cable should be of heavy duty, 3 core and rated to 15A, and suitable for outdoor applications.
• Never fill fuel tank indoors. Never fill fuel tank when engine is running or hot. Do not smoke when filling fuel tank.
• NEVER REFUEL WHEN THE GENERATOR IS RUNNING. Switch the generator to the off position prior to removing the fuel cap and refuelling.
• Not suitable for ethanol fuels.
• Engine speed has been factory set to provide safe operation. Tampering with the engine speed adjustment could result in overheating of attachments and could cause a fire. Never attempt to “speed-up” the engine to obtain more performance. Both the output voltage and frequency will be thrown out of standard by this practice, endangering attachments and the user.
• Do not parallel connect this generator with another generator, or any other power supply.

You MUST unplug any load from the generator before starting and stopping to prevent permanent damage to any appliances.

⚠️ WARNING

• Persons who are fitted with a heart pacemaker, or similar medical conditions should take care when using this device.
• Extension leads should be ordinary or heavy duty depending on the application of appropriate current rating, and in any case not less than 1mm² cross section of conductor for 10 A fittings, or 1.5mm² when 15 A fitting are used, and incorporates an earthing conductor to ensure that there is no voltage difference between the generating set and any equipment powered by the generating set.
• The electrical continuity of the “earthing” core should be checked periodically from pin to socket to ensure continued electrical safety.
• Some electrical appliances e.g. portable drills are marked ☐ or ‘double insulated’, in which case there will not be an earthing conductor in its mains lead (even though it may have a 3-pin plug).

Residual Risks

Despite proper use, inconspicuous residual risks cannot be completely ruled out. The following risks may arise due to the nature of the inverter:
• Injury to health from inhaling exhaust;
• Hearing loss if suitable ear protection is not worn.
### Safety Risk

#### Risk of electrocution and fire

<table>
<thead>
<tr>
<th>Hazard</th>
<th>What could happen</th>
<th>How to prevent it</th>
</tr>
</thead>
<tbody>
<tr>
<td>Improper storage of extension cord.</td>
<td>Extension cord can come into contact with hot engine parts resulting in damage. Using a damaged extension cord can result in electrocution or death.</td>
<td>Remove extension cord from the generator and store separately away from generator.</td>
</tr>
<tr>
<td>Operation of generator in rain, wet, icy, or flooded conditions.</td>
<td>Water is an excellent conductor of electricity! Water which comes in contact with electrically charged components can transmit electricity to the frame and other surfaces, resulting in electrical shock to anyone contacting them.</td>
<td>Operate generator in a clean, dry, well ventilated area. Make sure hands are dry before touching unit.</td>
</tr>
<tr>
<td>Placing generator on or against highly conductive surface, such as a steel walkway or metal roof.</td>
<td>Accidental leakage of electrical current could charge conductive surfaces in contact with the generator.</td>
<td>Place generator on low conductivity surface such as a concrete slab. ALWAYS operate generator a minimum of 2 meters from any conductive surface.</td>
</tr>
<tr>
<td>Use of worn, damaged or ungrounded extension cords.</td>
<td>Contact with worn or damaged extension cords could result in electrocution. Use of ungrounded cordsets could prevent operation of circuit breakers and result in electrical shock.</td>
<td>Inspect extension cords before use and replace with new cord if required. Always use a cordset having a grounding wire with an appropriate grounding plug. DO NOT use ungrounded plug.</td>
</tr>
<tr>
<td>Operation of unit when damaged, or with guards or panels removed.</td>
<td>Attempting to use the unit when it has been damaged, or when it is not functioning normally could result in fire or electrocution. Removal of guarding could expose electrically charged components and result in electrocution.</td>
<td>Do not operate generator with mechanical or electrical problem. Have unit repaired by an Authorised Service Centre. Do not operate generator with protective guarding removed.</td>
</tr>
</tbody>
</table>

#### Risk of fire

<table>
<thead>
<tr>
<th>Hazard</th>
<th>What could happen</th>
<th>How to prevent it</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attempting to fill the fuel tank while the engine is running.</td>
<td>Fuel and fuel vapours can become ignited by coming in contact with hot components such as the muffler, engine exhaust gases, or from an electrical spark.</td>
<td>Turn engine off and allow it to cool before adding fuel to the tank. Equip area of operation with a fire extinguisher certified to handle fuel fires.</td>
</tr>
<tr>
<td>Sparks, fire, hot objects</td>
<td>Cigarettes, sparks, fires, or other hot objects can cause fuel or fuel vapours to ignite.</td>
<td>Add fuel to tank in well ventilated area. Make sure there are no sources of ignition near the generator.</td>
</tr>
<tr>
<td>Improper storage of fuel</td>
<td>Improperly stored fuel could lead to accidental ignition. Fuel improperly secured could get into the hands of children or other unqualified persons.</td>
<td>Store fuel in an approved container designed to hold fuel. Store container in secure location to prevent use by others.</td>
</tr>
<tr>
<td>Tampering with factory set engine speed settings.</td>
<td>Engine speed has been factory set to provide safe operation. Tampering with the engine speed adjustment could result in overheating of attachments and could cause a fire.</td>
<td>Never attempt to “speed-up” the engine to obtain more performance. The output of this generator is electronically controlled and the change to the speed setting will not alter the electrical output.</td>
</tr>
<tr>
<td>Inadequate ventilation for generator</td>
<td>Materials placed against or near the generator or operating the generator in areas where the temperature exceeds 40°C. ambient (such as storage rooms or garages) can interfere with its proper ventilation features causing overheating and possible ignition of the materials or buildings.</td>
<td>Operate generator in a clean, dry, well ventilated area. DO NOT OPERATE UNIT INDOORS OR IN ANY CONFINED AREA.</td>
</tr>
<tr>
<td>Overfilling the fuel tank – fuel spillage.</td>
<td>Spilled fuel and its vapours can become ignited from hot surfaces or sparks.</td>
<td>Use care in filling the tank to avoid spilling fuel. Make sure fuel cap is secured tightly and check engine for fuel leaks before starting engine. Move generator away from refuelling area or any spillage before starting engine. Allow for fuel expansion. Never refuel with the engine running.</td>

### Parts List

1. 240V a.c Outlet 1 & 2 Power On/Off switch
2. 240V a.c Outlet 3 Power On/Off switch
3. Wheel foot
4. Engine On/Off switch
5. Side carry handles (2)
6. Folding carry handle
7. Low oil indicator light
8. Load Status indicator light
9. Power Supply indicator light
10. Muffler
11. Exhaust / spark arrestor
12. AC sockets (X3)
13. Fuel drain
14. Control panel
15. Oil Filler cap/dipstick
16. Oil drain plug
17. Ground (frame) terminal
18. Recoil starter
19. Choke lever
20. Air filter cover
21. Air Filter
22. Spark plug lead / cover
23. Spark Plug
24. Tap outlet
25. Fuel tap sediment cap
26. Fuel tap / lever
27. Fuel tank inlet filter
28. Feet (x4)
29. Wheel (x2)
30. 10mm Tube Spanner
31. 21mm Spark Plug Tube Spanner
32. Double Ended Screwdriver (Phillips and flat)
33. Multi Size Spanner
34. Fuel tank
35. Fuel tank cap
**Intended use of the Generator**

**Inverter technology**
This generator has been developed with inverter technology providing regulated, clean and “pure” electricity for a continuous uninterrupted stable power supply.

Inverter technology provides confidence as a power source for camping applications, outdoor lights, sound systems, televisions, microwaves and power tools.

Ideal for domestic emergency power applications and camping or caravaning where power may be required for higher wattage appliances such as caravan air conditioners.

Can also be used for large electric motors, powertools such as drills, jigsaws and grinders, appliances like toasters, microwave ovens or TVs, heating/lighting applications and small to medium fridges.

**NOTE:** Maintain normal safety precautions with appliances and accessories as for use on normal reticulated mains supply.

**Operating Periods**
**NOTE:** This product is for domestic DIY use only.

Maximum daily operational use should not exceed 10 hours a day.

It is not recommended to continually use the generator day after day.

**240V AC Connection**
This generator provides a clean digital output suitable for most electrical appliance/s including televisions, computers, laptops, caravans etc.

It comes fitted with 3 x 240V AC outlets, giving you the ability to run 3 x electrical appliances at the one time, as long as the combination of the maximum rating of each appliance does not exceed the maximum rated power of the generator.

The maximum operational combination on this generator is 3400W.

For a short period to aid appliances plugged in, start up will peak at 3600W.

**Other combinations:**

- Caravan fridge (200w) + toaster (1600w) + drill (1100w) = 2900w
- Caravan water heater (1500w) + globe (60w) + TV (200w) = 1760w
- Angle grinder (2000w) + TV (200w) + caravan fridge (200w) = 2400w
- Hair dryer (1600w) + caravan fridge (200w) + laptop (250w) = 2050w

</table>

**NOTE:** These figures are indicative only. Ensure you check the total rating of the appliance to be used before connecting to the generator. Refer to page 26.

Always connect the largest appliance you want to run first allowing it time to draw current to start. After 20-30 seconds connect the second appliance.
Assembly

This generator has been designed to be used as a stand alone / compact generator or a larger portable / wheeled type generator.

Compact Stand Alone Assembly

Assembly of the Feet

NOTE: These 4 feet (28) can be fitted even if the generator will be fitted with the wheeled option.

WARNING: Ensure the engine is switched off while undertaking this task.

This generator is supplied with 4 feet (28) which require the following assembly on the generator (within red markers) (Fig A):

1. Place the generator on a flat and level surface and then raise one side of the generator by placing a wooden block (or something similar) underneath the frame (Fig B) so the generator is slightly raised and allows you access to be able to add the feet (28).

WARNING: Do not turn the generator upside down or place the generator on its side. Ensure the generator is stable and cannot topple.

2. Insert the supplied hex head screw through the bottom of the foot so it comes out the opposite side.

Insert the supplied 10mm tube spanner (30), into the bottom of the foot to securely hold the hex head screw in place, (Fig C) then place the foot underneath the hole in the bottom frame and push through to the upper side (Fig D).

3. With the supplied 10mm tube spanner (30) still holding the hex head screw securely in place, apply the flat washer, spring washer, then the nut to the top of the hex head screw and tighten in a clockwise direction using the supplied multi-size spanner (33) (Fig E).

4. Repeat the same process for the other 3 feet (28). The generator can now be operated with the generator sitting on the ground or operating surface on the four rubber feet (28).

Portable Wheeled Type Generator Assembly

This generator is supplied with 2 wheels to assist with transportation, which require the following assembly:

1. Remove the cover of the wheel by holding one of the spokes of the outside cover on the wheel, and pulling towards you until the cover disengages and can be removed.

2. Insert the bolt through the outside of the wheel through to the other side, then follow the bolt through the hole in the corner frame of the generator (Fig F).

3. Using the 21mm spark plug tube spanner (31) to secure the bolt head in position, apply the nut onto the end of the bolt and tighten in a clockwise direction using the multi size spanner (33) (Fig G). Repeat for the second wheel.
Preparation

3600W Digital Inverter Generator with Pure Sine Wave

Indicators

This generator has three main LED indicators to indicate to the operator various conditions as follows:

1. Low oil indicator (Fig L)

The low oil indicator light (7) is a yellow LED and will illuminate when the oil level of the generator is too low. The generator will stop operating within 10 seconds if the yellow light comes on. The yellow LED will illuminate when the generator is being attempted to start if the oil is low, i.e. when the cord is being pulled, the yellow LED will glow if there is insufficient oil. In this condition, the generator will not start. In this condition you need to add oil for the generator to operate.

2. Load Status indicator (Fig M)

The red load status indicator light (8) advises the operator that a fault has been detected and the power supply to the control panel has been interrupted. When the red load status indicator is operating red, there is NO 240V a.c. available to the control panel.

When the engine is running the load status indicator light (8) flashes under the following conditions:

a. Flashing once indicates low voltage protection, caused by the engine rotation speed not meeting the specified requirements.

b. Flashing twice indicates the engine is overheated, caused by high temperature.

c. Flashing 3 times indicates overload protection caused by an excessive electrical overload.

d. Flashing 4 times indicates there is an electrical problem most likely caused by a short circuit.

Assembly of the Wheels

Following assembly of the wheels, it is recommended to assemble the additional wheel foot (3) for stability and to keep the generator on a level surface.

1. Raise the opposite end of the generator that the wheels have been assembled on by placing a wooden block (or something similar) underneath the bracket that the feet have been assembled on (Fig B).

2. Insert the supplied hex head screw through the bottom of the foot so it comes out the opposite side (Fig H).

Using the supplied 10mm tube spanner (30), insert into the foot and engage the head on the hex head screw. Thread the hex head screw into the large boss on the base frame cross member on the handle end of the generator (Fig I). Tighten firmly.

Assembly of the Folding Carry Handle

This generator is supplied with a folding carry handle (6) to assist with transportation when wheeling the generator around on the wheels.

1. Align the holes on each bracket of the carry handle with the holes on each side of the generator frame (Fig J).

2. With the handle in position, insert each screw through the outer bracket of the handle, then through the holes in the generator frame, and through to the opposite side of the internal bracket of the handle.

3. Secure the handle into position by applying the nyloc nuts onto the screws and securing finger tight.

Using the supplied double ended screwdriver (phillips head) (32) to hold the screw, then use the multi size spanner (33) in a clockwise direction to secure the nyloc nut in place (Fig K).
In any of the above instances, when the red load status indicator light (8) turns on, the power supply to the control panel will be disconnected automatically.

NOTE: The engine must be stopped and the issue resolved before the power supply will be restored.

3. Power Supply indicator (Fig N)
The power supply indicator light (9) is a green LED. It will only display green when there is a 240V output available, thus the generator must be operating. This indicator will remain on when the generator is operating and has 240Va.c. available to the control panel, with or without appliances connected to the AC sockets (12).

In an overload condition, there is no 240Va.c. available to the panel so the green indicator will not operate.

Preparing the Generator
It is important to check the generator before you commence operating the unit.

IMPORTANT: Ensure that the engine has oil. When leaving the factory, this generator has NO OIL in the engine.

NOTE: The engine will not start if the generator has no oil.

Checking the Engine Fuel

IMPORTANT: Fuel goes off after about 3-4 months. If you find your generator does not start, first change the fuel in the tank with newly purchased fresh unleaded fuel. Do not use ethanol based fuels.

WARNING:
• Do not refill fuel tank (34) while engine is running or is hot.
3. If the oil level is close to or below the lower level line, refill with 4 stroke oil to the upper level line (Fig O).
Do not use the generator when the oil level is close to the low level. Fill the oil tank before use each time.

4. If the oil is contaminated or has discoloured, ensure you change the oil. Replace the oil dipstick (15). DO NOT start the generator with the oil dipstick (15) not firmly replaced.

**NOTE:** This engine is fitted with a low oil indicator light (7). If the oil level is too low the engine will stop operating or the engine will not start. It is advised to check the oil level each time the generator is used and fill to the upper mark on the oil dipstick (15) by the above method. Do NOT over fill.

**Engine oil replacement**

1. Place the generator on a flat and level surface and warm up the engine for several minutes. Then stop the engine.

2. Place an oil pan under the generator and commence removing the oil drain plug (16) by using a 10mm socket (not supplied), and rotating in an anti-clockwise direction to remove, so that the oil can be completely drained from the oil tank (Fig P).

**NOTE:** Do not loose the small aluminium sealing washer on the thread of the oil drain plug.

3. Check the oil drain plug (16), gasket washer, oil filler cap (15) and O-ring. If these are damaged, have these replaced.

4. Reinstall the oil drain plug (16), and gasket washer using a 10mm socket (not supplied), and rotating in a clockwise direction until secure.

5. Refill with 4 stroke oil to the upper level line of the oil dipstick (15) as detailed above.

**CAUTION.** Check that no foreign material, debris, dust enters the crankcase.

6. Ensure to replace the oil filler cap (15).

---

**Starting your Generator**

**NOTE:** As the oil tank is not shipped with oil before starting the engine, ensure you have filled the oil tank to the correct level with oil, and make sure fuel has been added to the fuel tank (34).

1. Before starting, check to ensure the 240V a.c Outlet Power On/Off switches (1 & 2) are in the down “OFF” position, and ensure that no electrical appliance is connected to the generator by removing any appliance cords from the outlets (Fig. Q/R).

2. Turn the fuel tap / lever (26) clockwise to the ‘ON’ position (Fig. S). When vertical it is in the correct position.

3. Push the choke lever (19) towards the front of the generator to the full choke “START” position (Fig. T). Choke is not necessary if the engine is already warm and your restarting. The direction for the choke is also indicated below the choke lever (19) on the air filter cover (20).

---

**Engine Oil Operation**

**Q.**

**UPPER MARK**

**LOWER MARK**

**R.**

**ON**

**OFF**

**S.**

**OFF**

**T.**

**ON**

**RUN START**
4. Press the engine On/Off switch (4) to the “ON” green position as indicated by an “I” down (Fig. U). This generator will not start without this switch in the ON position.

5. To start the engine, slowly pull the recoil starter (18) until you feel it engage and then pull it briskly (Fig. V). When starting the engine for the very first time, it may require a number of attempts to start until the fuel has travelled from the tank to the engine. Slowly pull the recoil starter (18) to full extent 2 or 3 times to assist an enriched fuel mixture to enter the carburettor.

6. Once the engine starts, move the choke lever (19) backwards slowly (towards the rear of the generator) to the “RUN” position (Fig T). This ensures smooth operation when under load. Allow the generator to run for a moment unloaded to warm up before connecting appliances to be powered are connected. The LED power supply indicator (9) is now showing green and the unit is ready to provide power to the outlets (Fig W).

7. You can now one at a time, physically plug in your appliances to the available outlets. Ensure when plugged in the appliances are OFF and not requiring power. Ensure you have read the appliances manual for operation action to ensure the appliance doesn’t accidentally power on when turning on the power to the appliance (Fig X).

8. Switches 1 and 2 shown in Fig R control the flow of power to the available outlets. The 240Va.c Outlet 1&2 Power On/Off switch (1) controls outlet 1 and outlet 2. The 240Va.c Outlet 3 Power On/Off switch (2) controls outlet 3.

(Shading in image above shows which switch controls which outlet)
You may now move one or both of these switches to the UP “ON” position depending on how many appliances you are using. A reminder here that the generator will only power a product or combination of products up to a maximum of 3400W continually and a little higher 3600W at startup (Fig Y).

9. As you turn on the appliances and use them it will generate load on the generator and the engine speed fluctuate as requirements from the appliances increases and decreases. This is normal.

**WARNING:** All appliances are rated differently. This generator will work only with Australian approved rated appliances with an input voltage of 220-240V a.c (Fig Z). Check your appliances meet this requirement on its rating label before using them. In simple terms if you can’t use the product in your home you definitely cannot use it on this generator.

**Overload condition (Where the appliances want more power than the generator can provide)**

Once operating, if the AC side of the generator becomes overloaded, the red load status indicator (8) LED will illuminate. The generator will continue to supply 240V a.c output for a very short time, but if the load is not reduced, the 240V supply will be automatically shut down. To reduce load firstly you can stop using one appliance and turn it off, see if that rectifies the problem. If not refer to page 14 on loadings and how they work. If this does NOT solve your problem, you will need to reset an overload condition and shut down the engine of the generator, however ENSURE to follow the procedure and thus restart the engine after the load being applied to the generator has been reduced. Always connect the largest appliance you want to run first allowing it time to draw current to start. After 20-30 seconds connect the second appliance.

**Normal procedure for Stopping the Engine (Full shut down and Store)**

1. Turn “OFF” the 240V a.c Outlet Power On/Off switches (1 & 2) (Fig R).
2. Remove any appliances connected to either of the 3 outlets (Fig Q).
3. Allow the engine to slow down and idle for approx 15-30 seconds.
4. Press the engine On/Off switch (4) to the “OFF” position as indicated by an “O” (Fig. U). The unit will stop running.
5. Turn the fuel lever / tap (26) anti clockwise to the “OFF” position (Fig. AA)

**Overload procedure for restarting and resetting the engine**

1. Turn “OFF” the 240V a.c Outlet Power On/Off switches (1 & 2) (Fig R).
2. Allow the engine to slow down and idle for approximately 15-30 seconds.
3. Press the engine On/Off switch (4) to the “OFF” position as indicated by an “O” (Fig. AB). The unit will stop running and is shut down. Now follow the normal starting procedure to restart the generator.
Emergency Stop, and/or failure of On/off Switches (NOT RECOMMENDED EXCEPT IN EMERGENCY)

In the case of an emergency that requires the generator to be shut down as fast as possible:

1. Turn “OFF” the 240V a.c Outlet Power On/Off switches (1 and 2). If the switches have failed and power is still going to the appliance outlets quickly move to step 2.

2. Press the engine On/Off switch (4) to the “OFF” position as indicated by an “O” (Fig. AB). The unit should stop running.

If the switches have not shut down the generator, you can quickly remove / pull out the plugs of the appliances plugged into the outlets that need to be shut down.

3. Where the engine keeps operating, don’t panic, turn the fuel lever / tap (26) anti clockwise to the “OFF” position (Fig. AA). The generator will run out of fuel within one minute and then stop.

Do not use the generator again until the generator is serviced by an authorised service agent and the product is repaired, checked and the fault corrected.

As always in an emergency protect people that could be in harms way first.

Carbon build up

Carbon build up can be a problem on generators as the loading on the engine can vary considerably. Running the generator at low loading for extended periods can cause carbon build up.

Carbon build up in the engine can be reduced by operating the generator at approximately 75% of rated load for 25% of the time the generator is used. i.e, if the generator is used for 4 hours on low load i.e 800W or less, run the generator for 1 hour at around 75% of rating. This is only required if the generator has been used for less than 25% of rated load for extended periods i.e 2 hrs or more.

NOTE: For best operation and long engine life Use unleaded fuel without ethanol.

Periodic Maintenance

Regular maintenance is most important for the best performance and safe operation.
Generator Maintenance
Your generator should be kept clean and dry at all times. The generator should not be stored or operated in environments that includes excessive moisture, dust or any corrosive vapours. If these substances are on the generator, clean with a cloth or soft bristle brush. Do not use a garden hose or anything with water pressure to clean the generator. Water may enter the cooling air slots and could possibly damage the rotor, stator and the internal windings of the generator head.

Spark Plug
To ensure the engine is operating correctly, the spark plug must be properly gapped and free of carbon deposits. Always check the spark plug cable is firmly fitted to the top of the spark plug.

**WARNING:** Ensure the engine is switched off while undertaking this task.
1. Pull the spark plug lead (22) off the spark plug (23) and then remove spark plug (23) from the generator using the supplied 21mm Spark Plug Tube Spanner (31) by rotating in a clockwise direction (Fig AC).
2. Remove carbon deposits using a wire brush.
3. Check for discoloration on the top of the spark plug (23).
The standard colour should be a tan colour.
4. Check the spark plug gap. The acceptable gap should be between 0.6 – 0.8mm (Fig. AD).
5. The recommended spark plugs are as follows:
   - BPR6ES (NGK)
   - RN11YC (Champion)
   - WR6DC (Bosch)
**CAUTION:** Check that no foreign material, debris, or dust enters the crankcase.
Replacement spark plugs are available from purchase from lawn mower or small engine repair shops.

Air Filter
It is very important to maintain an air filter (21) in proper condition. Damage to the generator may arise if the filter has:
- Improperly been serviced.
- Dirt and other foreign elements adhering to the filter due to improper installation and engine wear.
It is recommended the air filter (21) is cleaned every 50 hours (every 10 hours under dusty conditions).
**WARNING:** Ensure the engine is switched off while undertaking this task.
1. Remove the air filter cover (20) on the side of the generator using the supplied 10mm tube spanner (30) by removing (unscrewing) the two screws on the face of the cover, in an anti-clockwise direction (Fig AE).
2. Remove the air filter (21) (Fig AF).
3. Wash the air filter (21) in hot soapy water and allow to dry.
4. Lubricate the air filter (21) using engine oil (SAE 10W-30).
5. Thoroughly squeeze the air filter (21) removing any excess oil.
6. Replace the air filter (21).
7. Secure the air filter cover (20) back on to the side panel of the air filter housing using the supplied 10mm Tube Spanner (30) by screwing back in the two screws in a clockwise direction until secure.
**IMPORTANT:** Never run the engine without the air filter element in place.
**CAUTION:** Never use fuel or low burning paint solvents to clean the air filter (21). A fire or explosion could result.
**CAUTION:** Ensure the air filter (21) is dry before refitting.
Replacement air filters are available from https://help.tools/ or by calling Customer Service on 1300 889 028.
Fuel Tank Inlet Filter

**WARNING:** Ensure the engine is switched off while undertaking this task.

1. Turn the fuel tap/lever (26) to the ‘off’ position (Fig AG).
2. The fuel tank inlet filter (27) is located directly under the fuel tank cap (35) and protects impurities entering the fuel tank (34) during refuelling. Remove the fuel tank cap (35) by turning in an anti-clockwise direction (Fig AH).
3. Remove the fuel tank inlet filter (27) (Fig AI) and wash thoroughly in petrol.
4. Re-assemble by putting the fuel tank inlet filter (27) back, and then securing the fuel tank cap (35) in a clockwise direction until firmly secured.

Tap Outlet Fuel Filter

**WARNING:** Ensure the engine is switched off while undertaking this task.

**NOTE:** The following procedure should be performed in a well ventilated area, with no naked flames, sparks, or cigarettes.

- Safety glasses should also be worn and on/off switch (4) set to the OFF position.

1. Ensure the fuel tap / lever (26) is in the OFF position (Fig AG).
2. Hold the tap housing and loosen the bottom sediment cup using an 11mm spanner (not supplied) (Fig AJ).
3. Remove the sediment cup from the bottom of the fuel tap / lever (26) (Fig AK). Be careful not to move the tap housing. Do not lose the small seal on the thread of the sediment cap.
4. The filter inside the sediment cup can be cleaned in petrol to remove any build-up of dirt on the outside of the filter. Do not operate the generator without this filter in place.
5. After cleaning the filter, replace the seal, then the filter, on top of the sediment cap and then insert the assembly back on the bottom of the fuel tap / lever (26) (Fig AL), and secure finger tight in an anti-clockwise direction. Using an 11mm spanner (not supplied), secure the sediment cap until tight (Fig AK).
6. Refill the tank with fuel and ensure there are no leaks between the tap and the tank, the tap and the sediment cap, and with the fuel tap / lever (26) turned on, ensure there are no leaks where the fuel hose is fitted to the outlet of the tap.
Storage and Transport

Cleaning
1. Keep your machine clean. The outside of the machine can be cleaned using a damp soft cloth with a mild detergent if required. Never use water to clean the generator as it may cause damage to internal parts.
2. Some maintenance products and solvents may damage the plastic parts; these include products containing benzene, trichloroethylene, chloride and ammonia.
3. Use a vacuum to clean air inlet and outlet louvres of the alternator.
4. Take special care to keep the ventilation inlets/outlets free from obstruction; cleaning with a soft brush followed by a compressed air jet will usually be sufficient to ensure acceptable internal cleanliness.
5. Wear eye protection when carrying out cleaning.

Storage
- Never store generator with fuel in the tank indoors or in enclosed, poorly ventilated areas, where fumes can reach an open flame, spark or pilot light as on a furnace, water heater, clothes dryer or other gas appliances.
- Ensure the fuel tank and carburettor are BOTH fully drained of fuel. Open the fuel drain (25) on the carburettor to drain the fuel totally from the fuel tank (34).
- Check the fuel tap / lever (26) is turned off (Fig V).
- Drain and replace the engine oil.
- Clean the generator with a damp soft cloth with mild detergent.
- Do not clean the generator with water.
- Check all nuts bolts and fasteners. Ensure they are tightened if needed before storage.

Warranty

Your new Workzone® Titanium Generator will more than satisfy your expectations. It has been manufactured under stringent Workzone® Titanium Quality Standards to meet superior performance criteria. You will find your new Generator easy and safe to operate, and, with proper care, it will give you many years of dependable service.

CAUTION. Carefully read through this entire instruction manual before using your new Workzone® Titanium Generator. Take special care to heed the Cautions and Warnings.

Your Workzone® Titanium Generator has many features that will make your job faster and easier. Safety, performance, and dependability have been given top priority in the development of this Generator, making it easy to maintain and operate.

Use only Workzone® Titanium replacement parts for your product. Non-conforming parts or modifications made to parts will void your warranty.
Environmental Protection
Recycle unwanted materials instead of disposing of them as waste. All tools, hoses and packaging should be sorted, taken to the local recycling centre and disposed of in an environmentally safe way. Dispose of used motor oil in a manner that is compatible with the environment.
We suggest you take it in a sealed container to your local service station for reclamation. Do not throw it in the trash or pour it into the earth.

What your 3 year warranty means
Great care has gone into the manufacture of this product and it should therefore provide you with years of good service when used properly. In the event of product failure within its intended use over the course of the first 3 years after the date of purchase, we will remedy the problem as quickly as possible once it has been brought to our attention. In the unlikely event of such an occurrence, or if you require any information about the product please contact us via our after sales support services, details of which can be found in this manual and on the product itself. After Sales Support TEL: 1300 889 028

Service Support
If you are having difficulty in using your product, you can find instructional videos on our website, www.powertoolsupport.com, by clicking on the Product Assistance tab > How To product Videos.
If you have any issues with the operation of your product, please take it with a copy of your receipt to one of our National Service Agents for repair or call us 1300 889 028 for advice.
A listing of our Service Agents is included with your product, however, you can also find our most updated listing on our website https://help.tools/ by clicking on the Service Agent link.

Troubleshooting

### Specifications

**AC output:** 240Vac ~ 50Hz  
**Rated power:** 3400W +/- 5%  
**Peak power:** 3600W +/- 5%  
**Phase:** Single  
**Power factor:** \( \cos \phi = 1 \)  
**Displacement:** 182cc  
**Motor:** 4 stroke  
**No load speed:** 3000 RPM  
**Fuel tank capacity:** 10.5L  
**Fuel type:** Unleaded  
**Oil tank capacity:** 600ml  
**Oil type:** 4 Stroke (SAE 10W-30)  
**Net weight:** 31kg  
**(with wheels and handle)**  
**Spark plug:** NGK BPR6ES  
**Product Dimensions:** 52cm x 41cm x 46cm (L x W x H) +/- 10%  
**Noise rating:** 72 dB (A) (taken at 7 metres)  
**You must wear ear protection at all times.**  
**This product complies with:** Safety – AS 3010 / AS 3011
ALDI guarantees that our exclusive brand products are developed to our stringent quality specifications. If you are not entirely satisfied with this product, please return it to your nearest ALDI store, within 60 days from the date of purchase, for a full refund or replacement, or take advantage of our after sales support by calling the supplier’s Customer Service Hotline.
