

## Craft Brew 850 maintenance schedule

Recommended maintenance schedule for the Craft Brew 850 Reverse Osmosis Brewing System.

Filter change:

Every three months change sediment, pre-carbon and post-carbon filters.

Membrane:

Every 2 to 3 years.

Depending on incoming water conditions, you may need to replace your membrane more often. Keep an eye on your product flow rate, TDS and your system pressure. If flow rates start to drop in system pressure starts to rise, you may need to change your membrane.

Using quality replacement filters and membranes is essential for long term performance. Go to our web site to re-order these maintenance items to maintain the high quality of your system.”
