We are passionate about our work

Our Story

In 1997, Jim Wilson, who as a kid loved amateur radio and after receiving his Ham radio license at 14 years old started making antennas in his parent’s garage, and in 1988 started his first of many successful companies, Wilson Antenna, manufacturing and selling CB antennas and two-way radios.

Eventually, Wilson Antenna became the market leader and its products were seen as a status symbol for truckers. After three years of intense research and development, Jim invented and patented the first cellular signal boosting solution giving way to who we are now, Wilson Electronics.

Recognized global leader in cellular boosting technology

Our Story

Established in 2000 in St. George, Utah

We hold over 40 U.S. cellular signal boosting patents.
How it Works

HOME & SMALL OFFICE

Dropped calls and slow data are generally caused by three things: distance from a cell tower, building materials in your home or office, or obstruction from tall objects such as trees, topography, and buildings.

weBoost devices are able to capture an exterior signal—even one that is far away—and amplify it in your car, home, or office. weBoost devices work on every network, for any carrier, to give you up to 32x your cell signal strength.
How to boost a cell signal

Signal boosters increase cell signal by collecting signals with a powerful antenna, delivering those signals to the booster, amplifying the cell signals so your devices receive them, and delivering your device's boosted signals back to the cell tower.

1. RECEIVES SIGNAL
The powerful antenna reaches out to access a voice and data signal, and delivers it to the booster.

2. BOOST SIGNAL
The booster receives the signal, amplifies it, and serves as a relay between your phone and the nearest cell tower.

3. BROADCASTS SIGNAL
Your devices get a stronger signal, and calls and data are fed through the booster back to the network.
