

WINTERIZING INSTRUCTIONS

REMOVE ANIMALS, FEED AND WATER FROM BARN WHILE USING WINTERIZING SOLUTION

1. Unplug the misting system.
2. Remove the suction and return line tubes from the reservoir while placing system lid with pumping unit attached in stable location.
3. Do not allow pumping unit to fall down into liquid.

4. Disconnect the suction filter from the suction line tubing.

5. In a bucket or other container, add a winterizing solution such as windshield de-icer or marine de-icer. **DO NOT** use anti-freeze!
6. Put both suction and return lines in the bucket or container.
7. With the system plugged in, manually run the system until all insecticide solution is pumped out of the tubing and nozzles and is replaced by the winterizing solution.

IMPORTANT! If you have a float switch, it will need to be in an upward direction for the system to operate.

8. Reattach the suction filter. Tie everything that hangs inside the reservoir under the reservoir lid and attach and secure lid to reservoir for the winter.
