

Kawasaki Versys & other models L-Bracket for Standard Flatfoot Clearance Installation Instructions

L-Shape Bracket Kit

L-shape Bracket

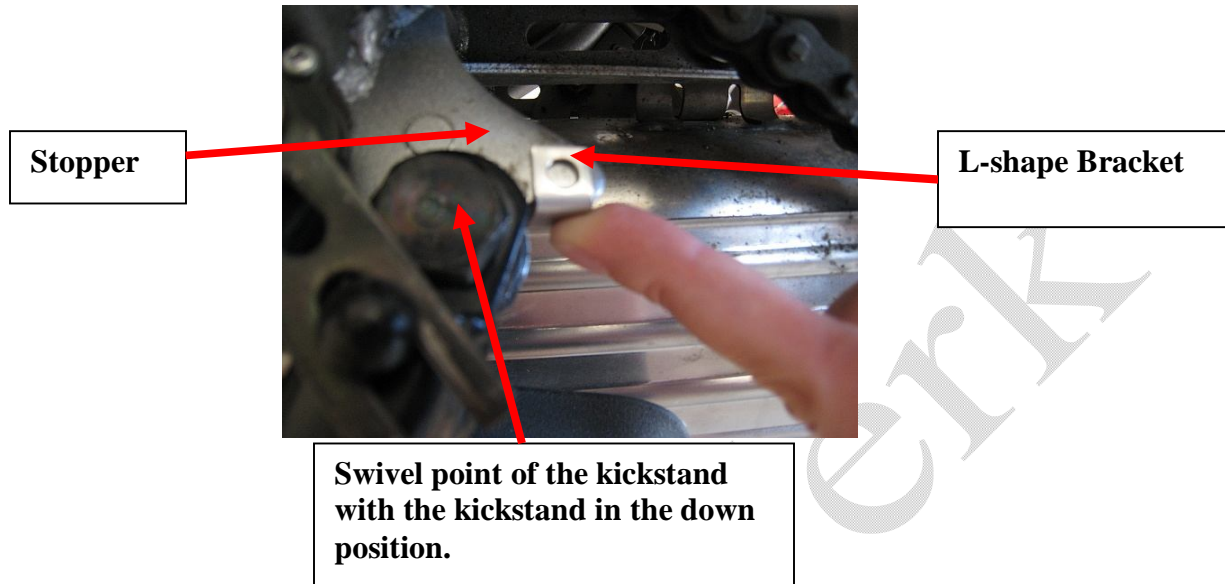

Phillips Screw with the self-locking nut

Tools Needed

- Electric Drill
- 4 mm (5/32) drill bit
- From your bike's toolkit:
 - Phillips screwdriver
 - Pliers

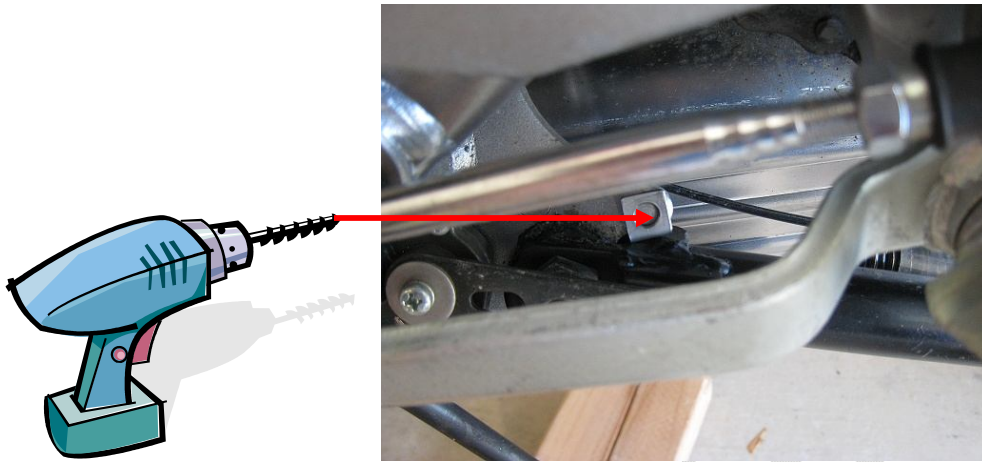

- 1) Place the L-shape Bracket on the stopper as shown with the kickstand in the down position (view from the left side of the bike)

- 2) With help of another person holding the bike, **swing the kickstand to the upright position**. This way, the kickstand will hold the bracket in place. This is the easiest and the safest way to drill the hole.

- 3) Drill the hole in the stopper through the hole in the L-shape Bracket as shown

- 4) Insert the provided Phillips Screw with the screw head on the outside and tighten it with the provided nut from the backside (inside).
- 5) Once secured, the installed L-shape Bracket will generate additional 25 mm (1 inch) clearance between the swing arm and the original kickstand foot.
