

Grip-N-Lock Well Caps

- The Grip-N-Lock is easy to install and cost-efficient; this cap does not require grouting, screwing, riveting, or gluing. You may use a glue method if desired.
- Designed to work with 4" pipe; either Schedule 40 or 80.
- Use safety goggles during installation of FootLoose Rv Site Sewer Cap.
- FootLoose Rv Site Sewer Cap is designed to fit over the 4" sewer pipe; the multiple concentric rings at the base secure and tighten when it is tapped into place.
- To install, place the Grip-N-Lock cap at the end of the PVC pipe and ensure it is aligned so that the top surface of the lid is perpendicular to the axis of the pipe.
- Use a rubber mallet (do not use a steel hammer) to gently tap the Grip-N-Lock

into place by tapping around the edge of the lid in a circular fashion.

- Tapping gently, work your way around the edge of the lid until the Footloose is fully seated on the top of the pipe.
- **CAUTION:** if you tap too hard in one place, the Grip-N-Lock will seat at an angle instead of perpendicular to the axis of the pipe. So, tap gently in a circle around the edge of the lid.
- Use a padlock or zip tie to lock out unauthorized personnel.
