# Precision, Caged Ball Screw

## Structure and Features

The use of a ball cage in the Ball Screw with the Ball Cage eliminates collision and friction between balls and increases the grease retention. This makes it possible to achieve a low noise, a low torque fluctuation and a long-term maintenance-free operation.

In addition, this Ball Screw is superbly capable of responding to the high speed because of an ideal ball recirculation structure, a strengthened circulation path and an adoption of the ball cage.

## Ball Cage Effect

### [Low Noise, Acceptable Running Sound]

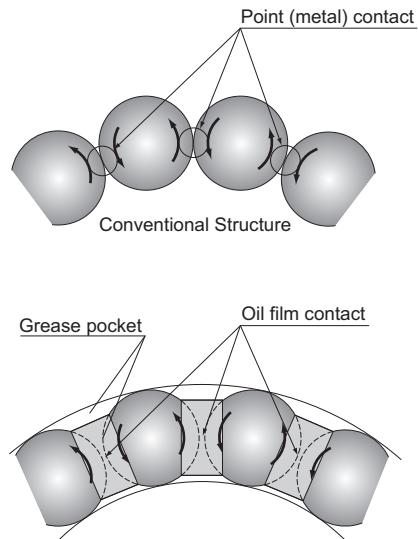

The use of the ball cage eliminates the collision noise between the balls. Additionally, as balls are picked up in the tangential direction, the collision noise from the ball circulation has also been eliminated.

### [Long-term Maintenance-free Operation]

The friction between the balls has been eliminated, and the grease retention has been improved through the provision of grease pockets. As a result, the long-term maintenance-free operation (i.e., lubrication is unnecessary over a long period) is achieved.

### [Smooth Motion]

The use of a ball cage eliminates the friction between the balls and minimizes the torque fluctuation, thus allowing the smooth motion to be achieved.

Ball Screw

## [Low Noise]

### ● Noise Level Data

Since the balls in the Ball Screw with the Ball Cage do not collide with each other, they do not produce a metallic sound and a low noise level is achieved.

### ■ Noise Measurement

[Conditions]

Item	Description
Sample	High load ball screw with ball cage HBN3210-5 Conventional type: model BNF3210-5
Stroke	600mm
Lubrication	Grease lubrication (lithium-based grease containing extreme pressure agent)

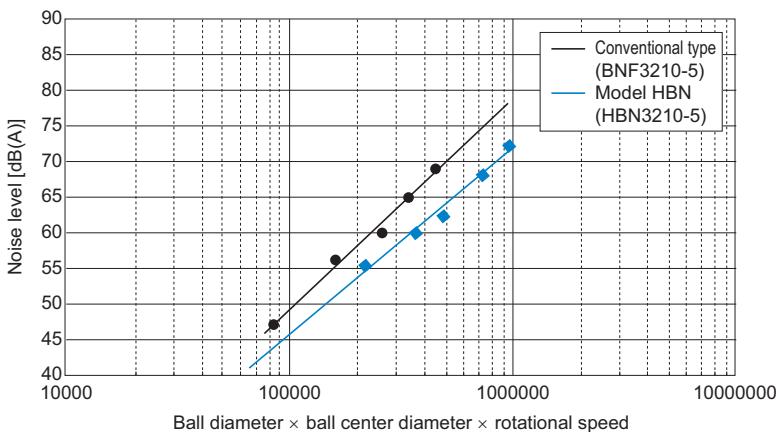

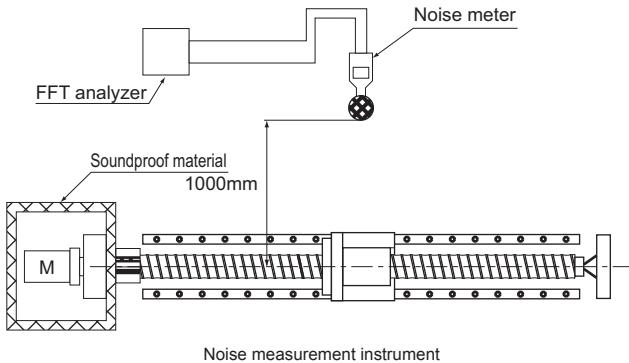

Fig.2 Ball Screw Noise Level

# Precision, Caged Ball Screw

## [Long-term Maintenance-free Operation]

### ● High speed, Load-bearing Capacity

Thanks to the ball circulating method supporting high speed and the caged ball technology, the Ball Screw with Ball Cage excels in high speed and load-bearing capacity.

### ■High Speed Durability Test

[Test conditions]

Item	Description
Sample	High Speed Ball Screw with Ball Cage SBN3210-7
Speed	3900(min <sup>-1</sup> )(DN value*: 130,000)
Stroke	400mm
Lubricant	THK AFG Grease
Quantity	12cm <sup>3</sup> (lubricated every 1000km)
Applied load	1.73kN
Acceleration	1G

\* DN value: Ball center-to-center diameter x revolutions per minute

[Test result]

Shows no deviation after running 10,000 km.

### ■Load Bearing Test

[Test conditions]

Item	Description
Sample	High Speed Ball Screw with Ball Cage SBN3210-7
Speed	1500(min <sup>-1</sup> )(DN value*: 50,000)
Stroke	300mm
Lubricant	THK AFG Grease
Quantity	12cm <sup>3</sup>
Applied load	17.3kN(0.5Ca)
Acceleration	0.5G

[Test result]

Shows no deviation after running a distance 2.5 times the calculated service life.

## [Smooth Motion]

### ● Low Torque Fluctuation

The caged ball technology allows smoother motion than the conventional type to be achieved, thus to reduce torque fluctuation.

[Conditions]

Item	Description
Shaft diameter/lead	32/10mm
Shaft rotational speed	60min <sup>-1</sup>

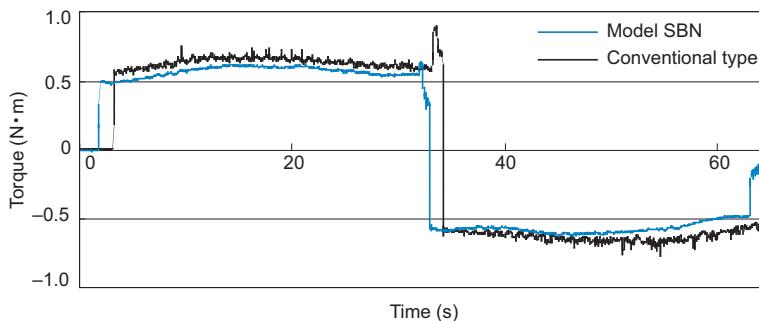

Fig.3 Torque Fluctuation Data

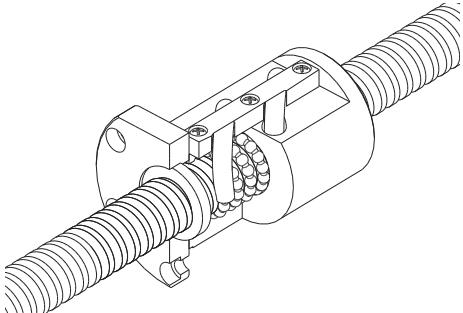

## Types and Features

### [Preload Type]

#### Model SBN

Model SBN has a circulation structure where balls are picked up in the tangential direction and is provided with a strengthened circulation path, thus to achieve a DN value of 130,000.

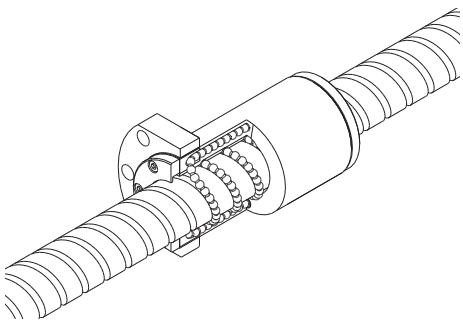

Specification Table⇒ **A15-70**

#### Model SBK

As a result of adopting the offset preloading method, which shifts two rows of grooves of the ball screw nut, a compact structure is achieved.

Specification Table⇒ **A15-74**

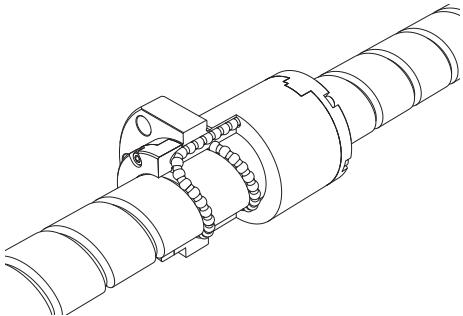

### [No Preload Type]

#### Model SDA

Model SDA achieves an ideal ball circulation structure and a significantly compact body by using newly developed end cap and R piece.

Specification Table⇒ **A15-78**

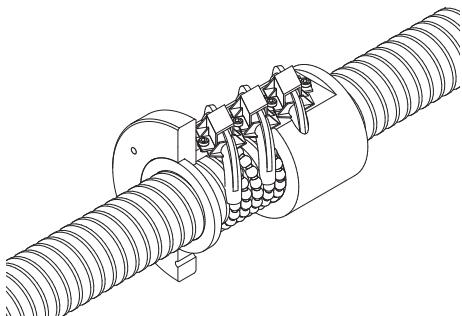

# Precision, Caged Ball Screw

## Model HBN

With the optimal design for high loads, this Ball Screw model achieves a rated load more than twice the conventional type.

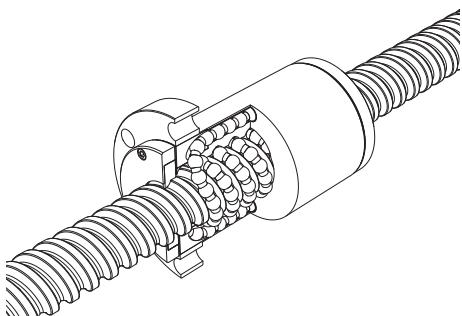

Specification Table⇒ **A15-80**

## Model SBKH

Model SBKH is a ball screw that achieves a high load carrying capacity and is capable of high-speed operation (92 m/min at a maximum).

Specification Table⇒ **A15-82**

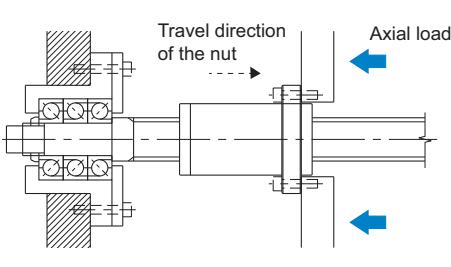

Ball Screw

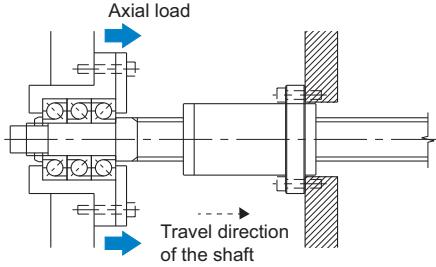

## Examples of Assembling Models HBN and SBKH

If using model HBN or SBKH under a large load, arrange the nut flange and the fixed-side support unit in relation to the loading direction as indicated in the figure below while taking into account the load balance of the balls. In addition, while HBN or SBKH is operating, be sure not to apply a tensile load to the bolts. If you intend to use HBN or SBKH in configurations other than below, contact THK.

### [Examples of Recommended Assembly of Models HBN and SBKH]

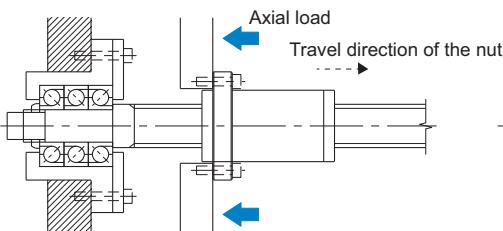

Good example (with the nut moving)

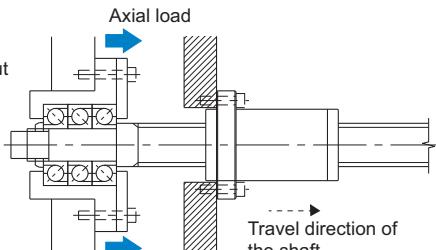

Good example (with the shaft moving)

### [Examples of Un-recommended Assembly of Models HBN and SBKH]

Bad example (with the nut moving)

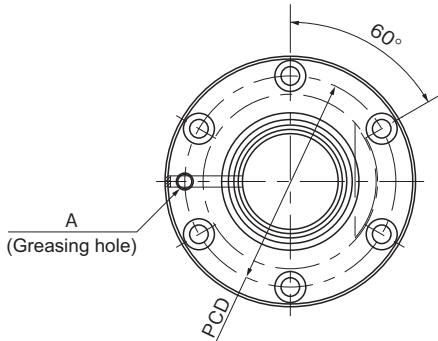

Bad example (with the shaft moving)

										6.31

Note) The rigidity values in the table represent the spring constants obtained from the load and the elastic deformation when providing a preload 10% of the basic dynamic load rating ( $C_a$ ) and applying an axial load three times greater than the preload.

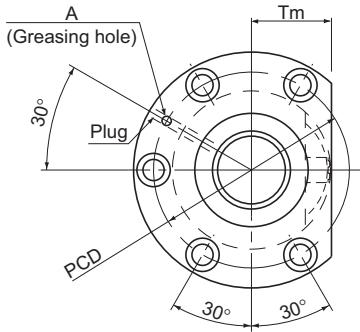

These values do not include the rigidity of the components related to mounting the ball screw nut. Therefore, it is normally appropriate to regard roughly 80% of the value in the table as the actual value.

If the applied preload ( $F_{a_0}$ ) is not 0.1  $C_a$ , the rigidity value ( $K_N$ ) is obtained from the following equation.

$$K_N = K \left( \frac{F_{a_0}}{0.1 C_a} \right)^{\frac{1}{3}}$$

K: Rigidity value in the dimensional table.

96	152	172	22	139	128	14	114	PT 1/8	7.05×10 <sup>-2</sup>	8.1	15.5

Note) The rigidity values in the table represent the spring constants obtained from the load and the elastic deformation when providing a preload 10% of the basic dynamic load rating (Ca) and applying an axial load three times greater than the preload.

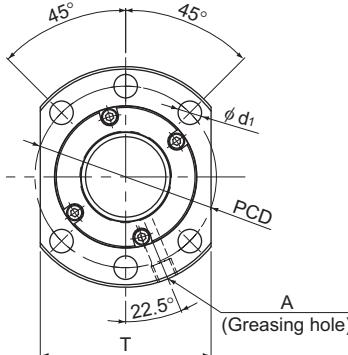

These values do not include the rigidity of the components related to mounting the ball screw nut. Therefore, it is normally appropriate to regard roughly 80% of the value in the table as the actual value.

If the applied preload ( $F_{a_0}$ ) is not 0.1 Ca, the rigidity value ( $K_N$ ) is obtained from the following equation.

$$K_N = K \left( \frac{F_{a_0}}{0.1Ca} \right)^{\frac{1}{3}}$$

K: Rigidity value in the dimensional table.

# DIN Standard compliant Ball Screw (DIN69051)

## Structure and Features

In the DIN standard compliant Ball Screw, balls under a load roll in the raceway cut between the screw shaft and the nut while receiving the axial load, travel along the groove of a deflector embedded inside the nut to the adjacent raceway, and then circulate back to the loaded area. Thus, the balls perform infinite rolling motion.

Two types of nuts are available: model EB of oversized-ball preload type or non-preloaded type, and model EP of offset preloaded type.

### [Compact]

This Ball Screw is compactly built. Because of an internal circulation system using deflectors, the outer diameter of the nut is 70 to 80% of the conventional double nut and the overall nut length is only 60 to 80% of the return pipe nut.

### [Compliant with a DIN standard]

The nut flange shape, mounting holes and rated load are compliant with DIN69051.

90	125	119	18	96	18	2	108	11	47.5	M8×1
95	135	136	18	108	27	2	115	13.5	50	M8×1

Note) The rigidity values in the table represent spring constants each obtained from the load and the Elastic Deformation finish when providing an axial load 24% of the basic dynamic load rating (Ca).

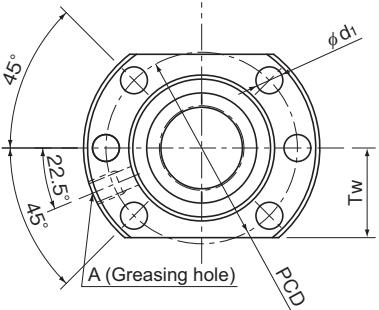

These values do not include the rigidity of the components related to mounting the nut. Therefore, it is normally appropriate to regard roughly 80% of the value in the table as the actual value.

If the axial load (Fa) is not 0.24 Ca, the rigidity value (K<sub>N</sub>) is obtained from the following equation.

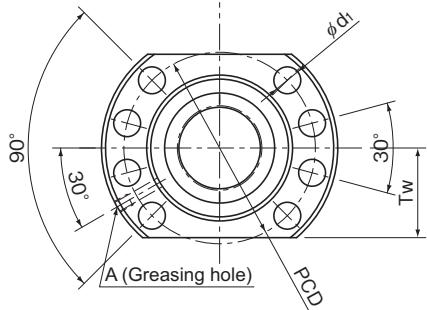

$$K_N = K \left( \frac{Fa}{0.24Ca} \right)^{\frac{1}{3}}$$

K: Rigidity value in the dimensional table.

90	125	142	18	119	18	2	108	11	47.5	M8×1

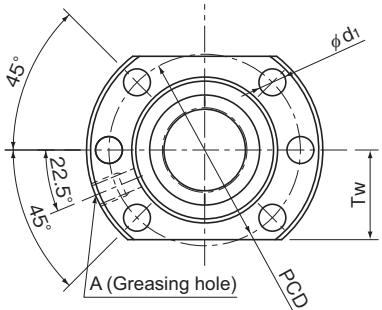

Note) The rigidity values in the table represent spring constants each obtained from the load and the elastic deformation when providing a preload 8% of the basic dynamic load rating (Ca) and applying an axial load three times greater than the preload. These values do not include the rigidity of the components related to mounting the nut. Therefore, it is normally appropriate to regard roughly 80% of the value in the table as the actual value.

If the applied preload (Fa0) is not 0.08 Ca, the rigidity value (K<sub>n</sub>) is obtained from the following equation.

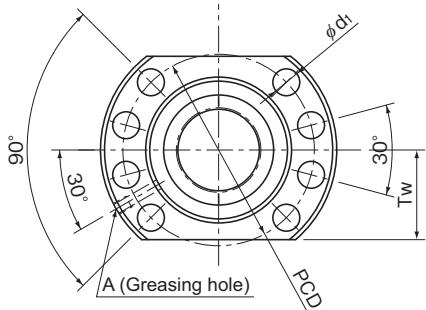

$$K_n = K \left( \frac{Fa_0}{0.08Ca} \right)^{\frac{1}{3}}$$

K: Rigidity value in the dimensional table.

Recommended Shapes of Shaft Ends	A15-324

## Structure and Features

This type of Ball Screw is mass manufactured by cutting the standardized screw shafts of Precision Ball Screws to regular lengths. Additional machining of the shaft ends can easily be performed.

To meet various intended purposes, THK offers several Ball Screw models with different types of nuts: the single-nut type (model BNF), the offset preload-nut type (model BIF) and the miniature Ball Screw (models MDK and MBF).

### [Contamination Protection]

Nuts of the following model numbers are attached with a labyrinth seal.

- All variations of models BNF and BIF
- Model MDK0802/1002/1202/1402/1404/1405

When dust or other foreign material may enter the Ball Screw, it is necessary to use a contamination protection device (e.g., bellows) to completely protect the screw shaft.

### [Lubrication]

The ball screw nuts are supplied with lithium soap-group grease with shipments.

(Models MDK and MBF are applied only with an anti-rust oil.)

### [Additional Machining of the Shaft End]

Since only the effective thread of the screw shaft is surface treated with induction-hardening (all variations of models BNF and BIF; model MDK 1405) or carburizing (all variations of model MBF; model MDK0401 to 1404), the shaft ends can additionally be machined easily either by grinding or milling.

In addition, since both ends of the screw shaft have a center hole, they can be cylindrically ground.

Surface hardness of the effect thread : HRC58 to 64

Hardness of the screw shaft ends

All variation of models BNF and BIF; model MDK 1405 : HRC22 to 27

All variations of model MBF; model MDK0401 to 1404 : HRC35 or below

THK has standardized the shapes of the screw shaft ends in order to allow speedy estimation and manufacturing of the Ball Screws.

The shapes of shaft ends are divided into those allowing the standard support units to be used (symbols H, K and J) and those compliant with JIS B 1192-1997 (symbols A, B and C). See **A15-324** for details.

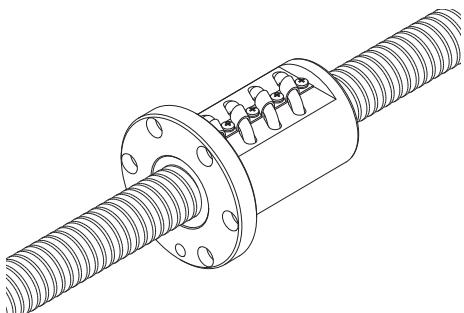

## Types and Features

### [Preload Type]

#### Model BIF

The right and left screws are provided with a phase in the middle of the ball screw nut, and an axial clearance is set at a below-zero value (under a preload). This compact model is capable of a smooth motion.

Specification Table⇒ **A15-116**

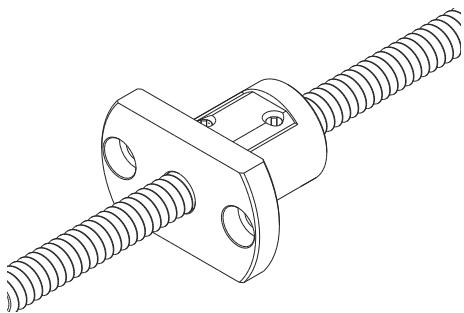

# Unfinished Shaft Ends Precision Ball Screw

[No Preload Type]

## Models MDK and MBF

A miniature type with a screw shaft diameter of  $\phi 4$  to  $\phi 14$  mm and a lead of 1 to 5mm.

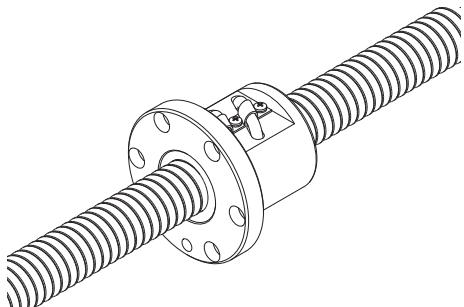

Specification Table⇒ A15-106

## Model BNF

The simplest type with a single ball screw nut. It is designed to be mounted using the bolt holes drilled on the flange.

Specification Table⇒ A15-116

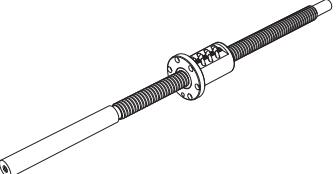

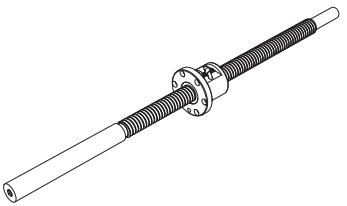

Ball Screw

## Nut Types and Axial Clearance

Screw shaft outer diameter (mm)	$\phi$ 4 to 14			
Nut type	Model MDK		Model MBF	
				
No preload type			No preload type	
Accuracy grades	C3, C5	C7	C3, C5	C7
Axial clearance (mm)	0.005 or less (GT)	0.02 or less (G2)	0.005 or less (GT)	0.02 or less (G2)

Note) The symbols in the parentheses indicate axial clearance symbols.

Screw shaft out diameter (mm)	$\phi$ 16 to 50			
Nut type	Model BIF		Model BNF	
				
Preload Type			No preload type	
Accuracy grades	C5	C7	C5	C7
Axial clearance (mm)	0 or less (G0)	0 or less (G0)	0.01 or less (G1)	0.02 or less (G2)

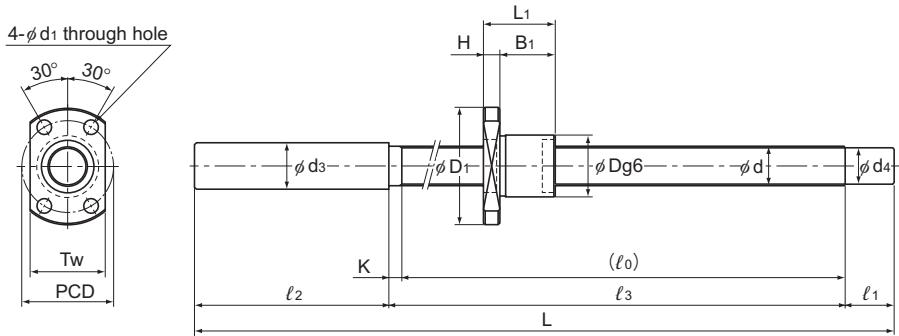

Note1) The symbols in the parentheses indicate axial clearance symbols.

Note2) Symbol "Ca" for preload indicates the basic dynamic load rating.

DN Value	A15-33
Support Unit	A15-316
Nut Bracket	A15-346
Dimensions of Each Model with an Option Attached	A15-360

## Features

To meet the space-saving requirement, this type of Ball Screw has a standardized screw shaft and a ball screw nut. The ends of the screw shaft are standardized to fit the corresponding support unit. The shaft support method with models BNK0401, 0501 and 0601 is "fixed-free," while other models use the "fixed-supported" method with the shaft directly coupled with the motor.

Screw shafts and nuts are compactly designed. When a support unit and a nut bracket are combined with a Ball Screw, the assembly can be mounted on your machine as it is. Thus, a high-accuracy feed mechanism can easily be achieved.

### [Contamination Protection and Lubrication]

Each ball screw nut contains a right amount of grease. In addition, the ball nuts of model BNK0802 or higher contain a labyrinth seal (with models BNK1510, BNK1520, BNK1616, BNK2020 and BNK2520, the end cap also serves as a labyrinth seal).

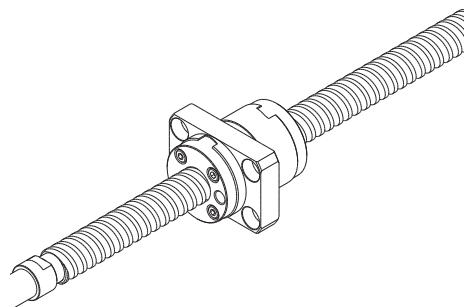

When foreign material may enter the screw nut, it is necessary to use a dust-prevention device (e.g., bellows) to completely protect the screw shaft.

## Types and Features

### Model BNK

For this model, screw shafts with a diameter  $\phi 4$  to  $\phi 25$  mm and a lead 1 to 20 mm are available as the standard.

## BNK0401-3 Shaft diameter: 4; lead: 1

Model No.	Stroke	Screw shaft length		
		$L_1$	$L_2$	$L_3$
BNK 0401-3G0+77LC3Y	20	45	54	77
BNK 0401-3G0+77LC5Y				
BNK 0401-3G2+77LC7Y	40	65	74	97
BNK 0401-3G0+97LC3Y				
BNK 0401-3G0+97LC5Y	70	95	104	127
BNK 0401-3G2+97LC7Y				
BNK 0401-3G0+127LC3Y	70	95	104	127
BNK 0401-3G0+127LC5Y				
BNK 0401-3G2+127LC7Y				

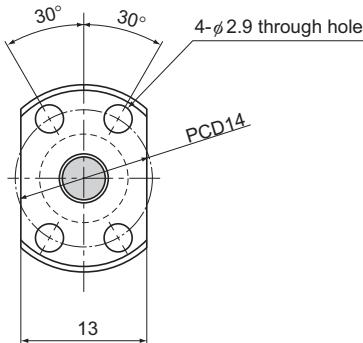

Note) A stainless steel type is also available for model BNK0401. When placing an order, add symbol "M" to the end of the model number.

(Example) BNK0401-3G0+77LC3Y M

Symbol for stainless steel type

For accuracy grades C3 and C5, clearance GT is also available as standard.

## Finished Shaft Ends Precision Ball Screw

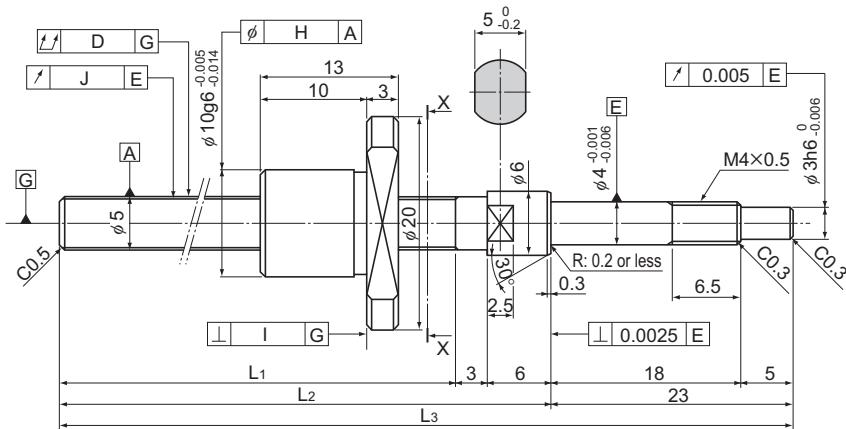

Ball Screw Specifications		
Lead (mm)	1	
BCD (mm)	4.15	
Thread minor diameter (mm)	3.4	
Threading direction, No. of threaded grooves	Rightward, 1	
No. of circuits	1 turn × 3 rows	
Clearance symbol	G0	GT G2
Axial clearance (mm)	0	0.005 or less 0.02 or less
Basic dynamic load rating Ca (kN)	0.29	0.29 0.29
Basic static load rating C <sub>a</sub> a (kN)	0.42	0.42 0.42
Preload torque (N·m)	to $9.8 \times 10^{-3}$	— —
Spacer ball	None	None None
Rigidity value (N/μm)	35	
Circulation method	Deflector	

Unit: mm

	Runout of the screw shaft axis D	Runout of the nut circumference H	Flange perpendicularity I	Runout of the thread groove surface J	Lead angle accuracy		Nut mass kg	Shaft mass kg/m

DN Value	A15-33
Support Unit	A15-316
Recommended Shapes of Shaft Ends	A15-324
Dimensions of Each Model with an Option Attached	A15-360

For THK Precision Ball Screws, a wide array of precision-ground screw shafts and ball screw nuts are available as standard to meet diversified applications.

## Structure and Features

### [Combinations of Various shaft Diameters and Leads]

You can select the combination of a shaft diameter and a lead that meet the intended use from the various nut types and the screw shaft leads. Those nut types include the return-pipe nuts, which represent the most extensive variations among the series, the compact simple nuts and the large-lead end-cap nuts.

### [Standard-stock Types (with Unfinished Shaft Ends/Finished Shaft Ends) are Available]

The unfinished shaft end types, which are mass manufactured by cutting the standardized screw shafts to the standard lengths, and those with finished shaft ends, for which the screw shaft ends are machined to match the corresponding support units, are available as the standard.

### [Accuracy Standards Compliant with JIS (ISO)]

The accuracy of the Ball Screw is controlled in accordance with the JIS standards (JIS B1192-1997).

	Precision Ball Screw						Rolled Ball Screw		
	C0	C1	C2	C3	C5	C7	C8	C10	
Accuracy grades									

Type	Series symbol	Grade	Remarks
For positioning	C	0, 1, 3, 5	JIS series
	Cp	1, 3, 5	
For transport	Ct	1, 3, 5, 7, 10	ISO compliant

### [Options that Meet the Environment are Available]

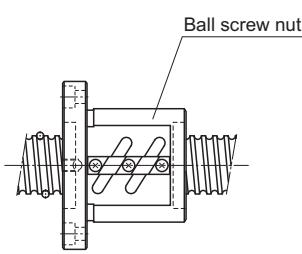

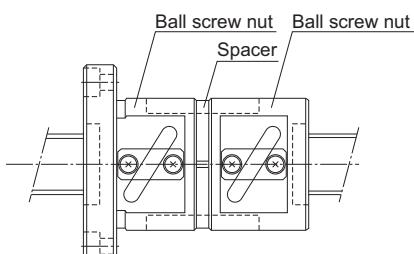

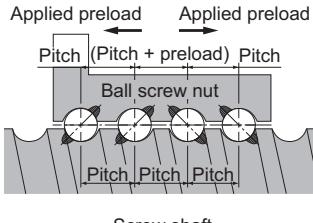

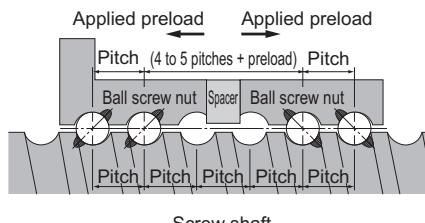

Options are available consisting of a lubricator (QZ), which enables the maintenance interval to be significantly extended, and a wiper ring (W), which improves the ability to remove foreign materials in adverse environments.

### [Structure and Features of Offset Preload Type Simple-Nut Ball Screw]

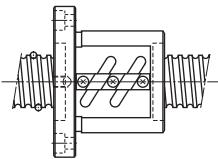

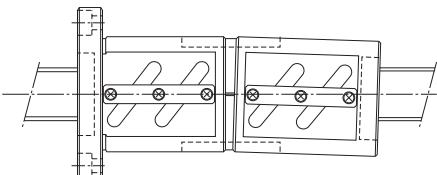

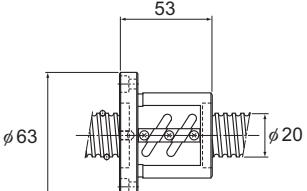

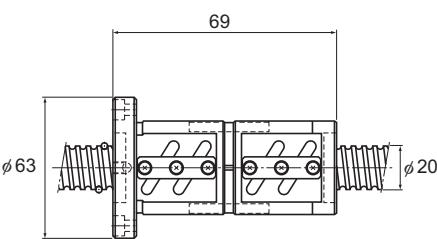

The Simple-Nut Ball Screw is an offset preload type in which a phase is provided in the middle of a single ball screw nut, and an axial clearance is set at a below-zero value (under a preload).

The Simple-Nut Ball Screw has a more compact structure and allows smoother motion than the conventional double-nut type (spacer inserted between two nuts).

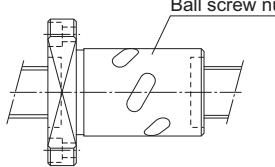

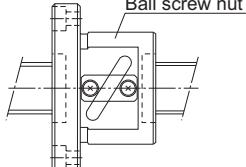

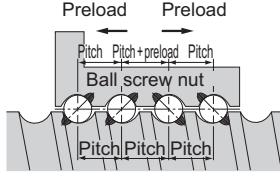

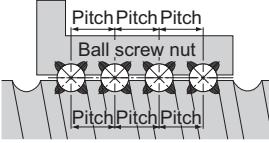

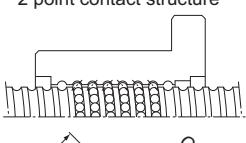

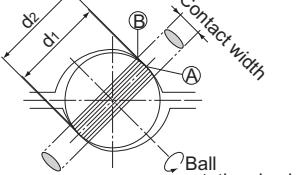

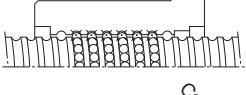

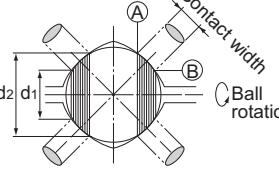

### [Comparison between the Simple Nut and the Double-Nuts]

Simple-Nut Ball Screw	Conventional Double-Nut Type Ball Screw
	
Preloading Structure	
	

# Precision Ball Screw

Simple-Nut Ball Screw	Conventional Double-Nut Type Ball Screw
Rotational Performance	
The preload adjustment with Simple Nut Ball Screw is performed according to the ball diameter. This eliminates the inconsistency in the contact angle, which is the most important factor of the Ball Screw performance. It also ensures the high rigidity, the smooth motion and the high wobbling accuracy.	The use of a spacer in the double-nuts tends to cause inconsistency in the contact angle due to inaccurate flatness of the spacer surface and an inaccurate perpendicularity of the nut. This results in a non-uniform ball contact, an inferior rotational performance and a low wobbling accuracy.
 	
Dimensions	
Since Simple-Nut Ball Screw is based on a preloading mechanism that does not require a spacer, the overall nut length can be kept short. As a result, the whole nut can be lightly and compactly designed.	 <p>Simple-Nut</p>  <p>Double-Nut</p>

[Comparison between the Offset Preload Type of Simple-Nut Ball Screw and the Oversized-ball Preload Nut Ball Screw]

Simple-Nut Ball Screw Model DIK	Conventional Oversized-ball Preload Nut Ball Screw Model BNF
	
Preloading Structure	
 <p>Screw shaft</p>	 <p>Screw shaft</p>
Accuracy Life	
<p>Simple-Nut Ball Screw model DIK has a similar preloading structure to that of the double-nut type although the former only has one ball screw shaft. As a result, no differential slip or spin occurs, thus to minimize the increase in the rotational torque and the generation of heat. Accordingly, a high level of accuracy can be maintained over a long period.</p>	<p>With the oversized-ball preload nut Ball Screw, a preload is provided through the balls each in contact with the raceway at four points. This causes differential slip and spin to increase the rotational torque, resulting in an accelerated wear and a heat generation. Therefore, the accuracy deteriorates in a short period.</p>

## Types and Features

### [Preload Type]

#### **Model BIF**

The right and the left screws are provided with a phase in the middle of the ball screw nut, and an axial clearance is set at a below-zero value (under a preload). This compact model is capable of a smooth motion.

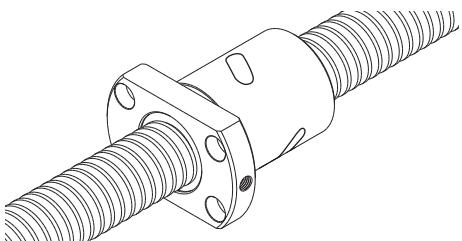

Specification Table⇒**A15-182**

#### **Model DIK**

The right and the left screws are provided with a phase in the middle of the ball screw nut, and an axial clearance is set at a below-zero value (under a preload). This compact model is capable of a smooth motion.

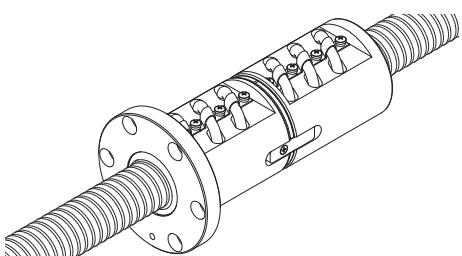

Specification Table⇒**A15-182**

#### **Model BNFN**

The most common type with a preload provided via a spacer between the two combined ball screw nuts to eliminate the backlash. It can be mounted using the bolt holes drilled on the flange.

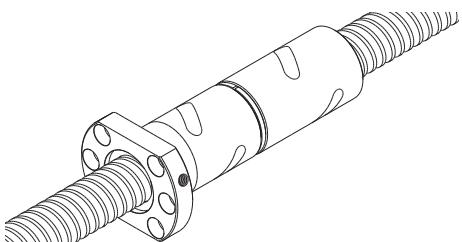

Specification Table⇒**A15-182**

#### **Model DKN**

A preload is provided via a spacer between the two combined ball screw nuts to achieve a below-zero axial clearance (under a preload).

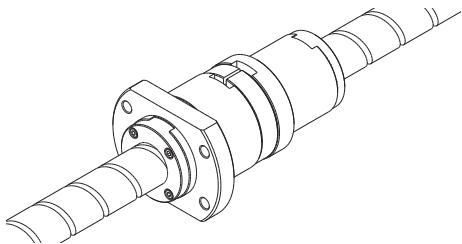

Specification Table⇒**A15-202**

## Model BLW

Since a preload is provided through a spacer between two large lead nuts, high-speed feed without backlash is ensured.

Specification Table⇒ [A15-182](#)

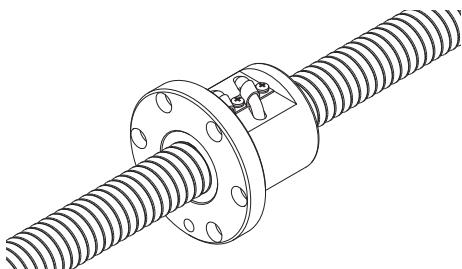

[No Preload Type]

## Model BNF

The simplest type with a single ball screw nut. It is designed to be mounted using the bolt holes drilled on the flange.

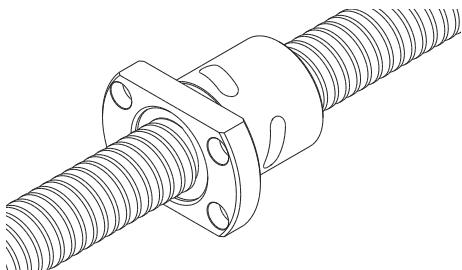

Specification Table⇒ [A15-218](#)

## Model DK

The most compact type, with a ball screw nut diameter 70 to 80% of that of the return-pipe nut.

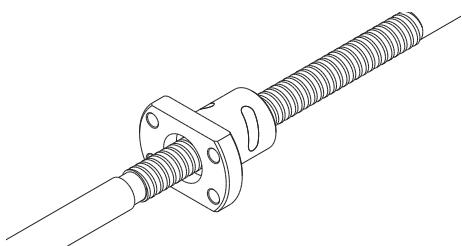

Specification Table⇒ [A15-216](#)

## Model MDK

A miniature type with a screw shaft diameter of  $\phi 4$  to  $\phi 14$  mm and a lead of 1 to 5mm.

Specification Table⇒ [A15-216](#)

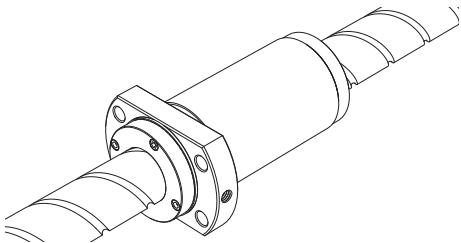

## Model WHF

This Ball Screw for high-speed feed achieves a DN value of 120,000 by using a new circulation structure.

Since the nut outer diameter and the mounting holes of this model are dimensionally interchangeable with the previous model WGF, model WGF can be replaced with this model. (WHF1530, WHF2040 and WHF2550)

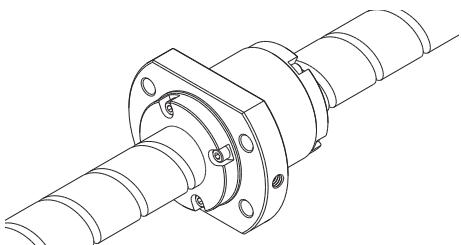

Specification Table⇒[A15-216](#)

## Models BLK/WGF

With model BLK, the shaft diameter is equal to the lead dimension. Model WGF has a lead dimension 1.5 to 3 times longer than the shaft diameter.

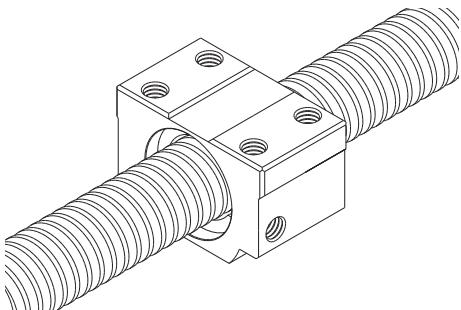

Specification Table⇒[A15-216](#)

## Square Ball Screw Nut Model BNT

Since mounting screw holes are machined on the square ball screw nut, this model can compactly be mounted on the machine without a housing.

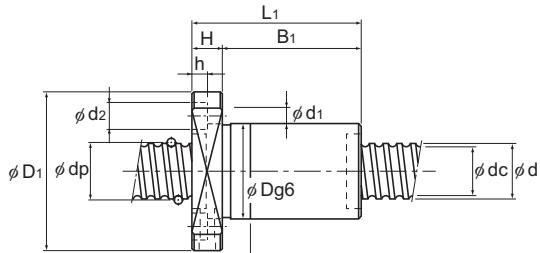

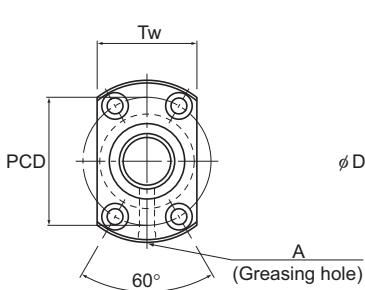

Specification Table⇒[A15-246](#)

## Structure and Features

### [Model DIR]

Standard-Lead Rotary-Nut Ball Screw model DIR is a rotary-nut Ball Screw that has a structure where a simple-nut Ball Screw is integrated with a support bearing.

Its ball screw nut serves as a ball recirculation structure using deflectors. Balls travel along the groove of the deflector mounted in the ball screw nut to the adjacent raceway, and then circulate back to the loaded area to complete an infinite rolling motion.

Being an offset preload nut, the single ball screw nut provides different phases to the right and left thread in the middle of the nut, thus to set the axial clearance below zero (a preload is provided). This allows more compact, smoother motion to be achieved than the conventional double-nut type (a spacer is inserted between two nuts).

The support bearing comprises of two rows of DB type angular bearings with a contact angle of 45° to provide a preload. The collar, previously used to mount a pulley, is integrated with the ball screw nut. (See the A section.)

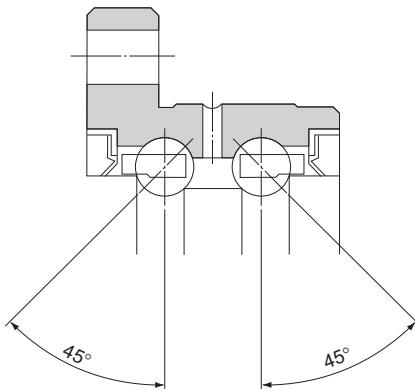

Fig.1 Structure of the Support Bearing

Ball Screw

#### ● Compact

Because of the internal circulation mechanism using a deflector, the outer diameter is only 70 to 80%, and the overall length is 60 to 80%, of that of the return-pipe nut, thus to reduce the weight and decrease the inertia during acceleration.

Since the nut and the support bearing are integrated, a highly accurate, and a compact design is achieved. In addition, small inertia due to the lightweight ball screw nut ensures high responsiveness.

#### ● Capable of Fine Positioning

Being a Standard-Lead Ball Screw, it is capable of fine positioning despite that the ball screw nut rotates.

#### ● Accuracy can Easily be Established

As the support bearing is integrated with the outer ring, the bearing can be assembled with the nut housing on the end face of the outer ring flange. This makes it easy to center the ball screw nut and establish accuracy.

#### ● Well Balanced

Since the deflector is evenly placed along the circumference, a superb balance is ensured while the ball screw nut is rotating.

- **Stability in the Low-speed Range**

Traditionally, motors tend to have an uneven torque and a speed in the low-speed range due to the external causes. With model DIR, the motor can be connected independently with the screw shaft and the ball screw nut, thus to allow micro feeding within the motor's stable rotation range.

- [Model BLR]**

The Rotary Ball Screw is a rotary-nut ball screw unit that has an integrated structure consisting of a ball screw nut and a support bearing. The support bearing is an angular bearing that has a contact angle of 60°, contains an increased number of balls and achieves large axial rigidity.

Model BLR is divided into two types: Precision Ball Screw and Rolled Screw Ball.

- **Smooth Motion**

It achieves smoother motion than rack-and-pinion based straight motion.

- **Low Noise even in High-speed Rotation**

Model BLR produces very low noise when the balls are picked up along the end cap. In addition, the balls circulate by passing through the ball screw nut, allowing this model to be used at high speed.

- **High Rigidity**

The support bearing of this model is larger than that of the screw shaft rotational type. Thus, its axial rigidity is significantly increased.

- **Compact**

Since the nut and the support bearing are integrated, a highly accurate, and a compact design is achieved.

- **Easy Installation**

By simply mounting this model to the housing with bolts, a ball screw nut rotating mechanism can be obtained. (For the housing's inner-diameter tolerance, H7 is recommended.)

## Accuracy Standards

### [Model DIR]

The accuracy of model DIR is compliant with the JIS standard (JIS B 1192-1997) except for the radial runout of the circumference of the ball screw nut from the screw axis (D) and the perpendicularity of the flange-mounting surface against the screw axis (C).

## Example of Assembly

### [Example of Mounting Ball Screw Nut Model DIR]

Installation to the housing can be performed on the end face of the outer ring flange.

### [Example of Mounting Ball Screw Nut Model BLR]

Standard installation method

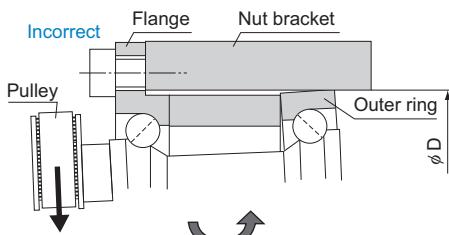

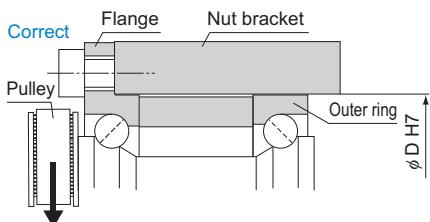

Inverted flange

Note) If the flange is to be inverted, indicate "K" in the model number. (applicable only to model BLR)

Example: BLR 2020-3.6 K UU

Symbol for inverted flange (No symbol for standard flange orientation)

### [Important note concerning model BLR]

Note) Since the outer rings are separable, it is necessary to include an internal diameter tolerance in the nut bracket so that the outer ring on the side opposite from the flange does not shift. (H7 is recommended.)

# Precision Rotary Ball Screw

## [Example of Mounting Model BLR on the Table]

- (1) Screw shaft free, ball screw nut fixed  
(Suitable for a long table)

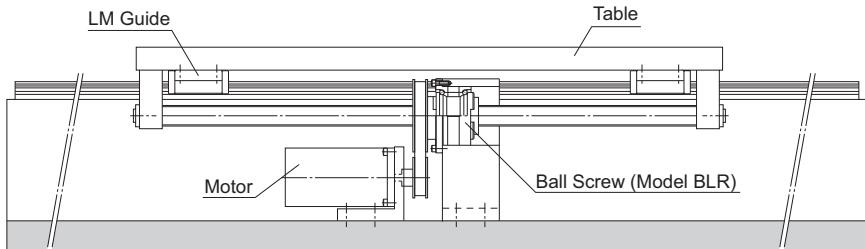

Fig.2 Example of Installation on the Table (Ball Screw Nut Fixed)

- (2) Ball screw nut free, screw shaft fixed  
(Suitable for a short table and a long stroke)

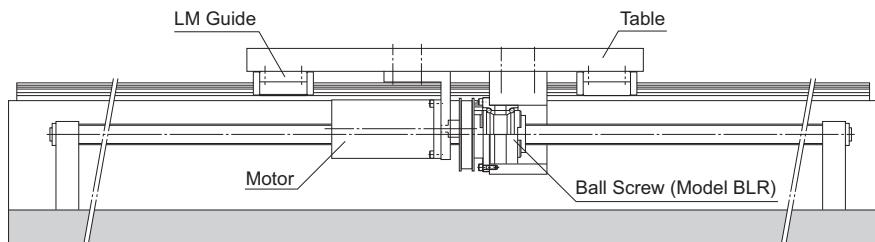

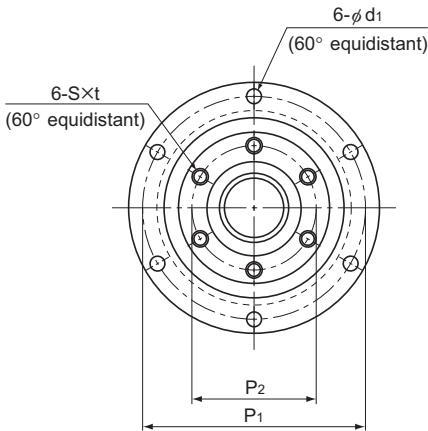

Fig.3 Example of Installation on the Table (Screw Shaft Fixed)

	62	14	33	120	113	67	10	23	M8	12	9	21.5	36.8	22.5	3.9	8.5

Note) The rigidity values in the table represent spring constants each obtained from the load and the elastic deformation when providing a preload 10% of the basic dynamic load rating (Ca) and applying an axial load three times greater than the preload.

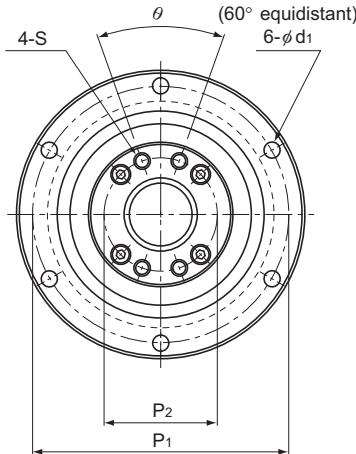

These values do not include the rigidity of the components related to mounting the ball screw nut. Therefore, it is normally appropriate to regard roughly 80% of the value in the table as the actual value.

If the applied preload ( $F_{a0}$ ) is not 0.1 Ca, the rigidity value ( $K_N$ ) is obtained from the following equation.

$$K_N = K \left( \frac{F_{a0}}{0.1Ca} \right)^{\frac{1}{3}}$$

K: Rigidity value in the dimensional table.

## Permissible Rotational Speeds for Rotary Ball Screws

The permissible rotational speeds for models DIR and BLR and rotary ball screws is restricted to whichever is lower of the support bearing permissible rotational speed, the DN value (70,000) and the critical speed of the screw. When using the product, do not exceed the permissible rotational speed.

Table1 Model DIR permissible rotational speed

## Structure and Features

The Ball Screw/Spline contains the Ball Screw grooves and the Ball Spline groove crossing one another. The nuts of the Ball Screw and the Ball Spline have dedicated support bearings directly embedded on the circumference of the nuts.

The Ball Screw/Spline is capable of performing three (rotational, linear and spiral) modes of motion with a single shaft by rotating or stopping the spline nut.

It is optimal for machines using a combination of rotary and straight motions, such as scholar robot's Z-axis, assembly robot, automatic loader, and machining center's ATC equipment.

### **[Zero Axial Clearance]**

The Ball Spline has an angular-contact structure that causes no backlash in the rotational direction, enabling highly accurate positioning.

### **[Lightweight and Compact]**

Since the nut and the support bearing are integrated, highly accurate, compact design is achieved. In addition, small inertia because of the lightweight ball screw nut ensures high responsiveness.

### **[Easy Installation]**

The Ball Spline nut is designed so that balls do not fall off even if the spline nut is removed from the shaft, making installation easy. The Ball Screw/Spline can easily be mounted simply by securing it to the housing with bolts. (For the housing's inner-diameter tolerance, H7 is recommended.)

### **[Smooth Motion with Low Noise]**

As the Ball Screw is based on an end cap mechanism, smooth motion with low noise is achieved.

### **[Highly Rigid Support Bearing]**

The support bearing on the Ball Screw has a contact angle of  $60^\circ$  in the axial direction while that on the Ball Spline has a contact angle of  $30^\circ$  in the moment direction, thus to provide a highly rigid shaft support.

In addition, a dedicated rubber seal is attached as standard to prevent entry of foreign materials.

# Precision Ball Screw/Spline

## Accuracy Standards

The Ball Screw/Spline is manufactured with the following specifications.

### [Ball Screw]

Axial clearance : 0 or less

Lead angle accuracy : C5

(For detailed specifications, see **A15-12, A15-19.**)

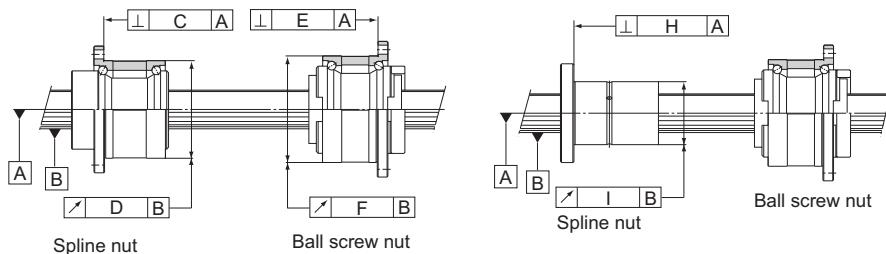

### [Ball Spline]

Clearance in the rotational direction : 0 or less (CL: light preload)

(For detailed specifications, see **A3-29.**)

Accuracy grade : class H

(For detailed specifications, see **A3-33.**)
