

Compliant with ISO, DIN, and JIS standards

NEW

High-Speed, Compact Caged Ball Screw

SDA-V/SDAN-V

Enables High-Speed, Compact Machine Designs

SDA-V

SDA-V/SDAN-V

■ High speed

Picks up balls in the tangential direction and achieves a maximum rotational speed of 5,000 min⁻¹ (DN value: 160,000).

Torque remains stable even during long periods of high-speed operation.

SDA-V/SDAN-V
(Caged Ball type)

Maximum DN value
160,000

Conventional precision ball screw
(Caged Ball type)

Maximum DN value
130,000

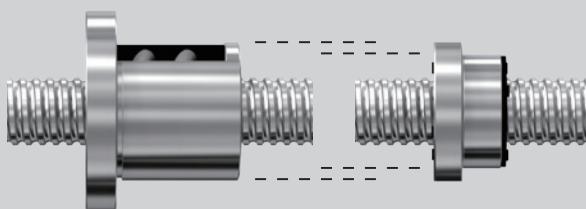

■ Conforms to DIN standards

The outer diameter is up to 30% more compact than previous THK products.

Enables compact machine designs.

Nut dimensions conform to ISO standards (ISO 3408).

Conventional precision ball screw

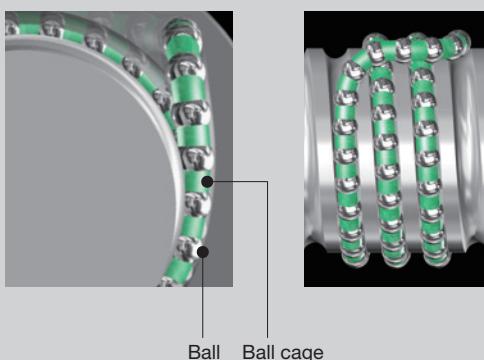

SDA-V

Enables High-Speed, Compact Machine Designs

■ Picks up balls in the tangential direction

Newly developed circulation components enable an ideal ball circulation structure.

■ SDA-V/SDAN-V lineup

A diverse product lineup to meet your varied needs.

Full-ball types are also available.

*The above chart is the lineup as of July 2020.

SDAN-V

SDAN-V

Suitable when it is necessary to minimize displacement from the force of cutting in NC machine tools and precision equipment.

- Designed with higher axial rigidity than the SDA-V.
- A double nut is used to achieve axial clearance of 0 or less.

Full-ball types are also available. To request full-ball types, please contact THK.

■ Model Number Coding Sample

Lead Angle Accuracy and Axial Clearance

Lead Angle Accuracy

Complies with conventional JIS (Japanese Industrial Standards) as well as ISO (international standards) and DIN (German industry standards).

Accuracy Standards Correspondence Table

Accuracy standards	Lead angle accuracy (permissible value)						
	JIS	C0	C1	C2*	C3	C5	C7*
ISO (DIN)	—	Cp1	—	Cp3	Cp5	—	

*THK standard lead angle accuracy

Axial Clearance

The table on the right shows the axial clearance of the precision ball screw.

G0 and GT clearance are standard for the SDA-V.

*For $\phi 10$ and $\phi 12$ only, any axial clearance from G0 to G3 may be selected.
SDAN-V is only available with G0 clearance.

Clearance symbol	Unit: mm				
	G0	GT	G1	G2	G3
Axial clearance	0 or less	0 to 0.005	0 to 0.01	0 to 0.02	0 to 0.05

*For SDA-V $\phi 12$, any clearance may be selected.

Static Safety Factor

Basic Static Load Rating C_{0a}

The basic static load rating (C_{0a}) generally equals the permissible axial load of a ball screw. In certain conditions, it is necessary to take static safety factors into account with regard to the calculated load. For instance, when the ball screw is stationary or in motion, an unexpected external force may be applied due to inertia caused by an impact or starting and stopping.

Static Safety Factor f_s

$$F_{a_{max}} = \frac{C_{0a}}{f_s}$$

f_s : Static safety factor
 C_{0a} : Basic static load rating* (kN)
 $F_{a_{max}}$: Permissible axial load (kN)

Static Safety Factor (f_s)

Machine	Load conditions	Lower limit of f_s
General industrial machinery	Without vibration or impacts	1.0 to 3.5
	With vibration or impacts	2.0 to 5.0
Machine tools	Without vibration or impacts	1.0 to 4.0
	With vibration or impacts	2.5 to 7.0

*The basic static load rating (C_{0a}) is a static load with a constant direction and magnitude whereby the sum of the permanent deformation of a ball and that of a rolling groove on a contact area under the maximum stress is 0.0001 times that of the ball diameter. With the ball screw, it is defined as the axial load. (Specific values of each ball screw model are indicated in the specification tables for the corresponding model.)

Nominal Life and Service Life in Hours

Basic dynamic load rating C_a

The basic dynamic load rating (C_a) is used in calculations of service life for when the ball screw is under an axial load. The basic dynamic load rating (C_a) indicates the load for which the nominal life L equals 10^6 (rev) when a group of identical ball screws independently operate under that load and it is applied with a constant direction and size. (The basic dynamic load ratings (C_a) for each model number are indicated in the specification tables.)

Nominal Life L_{10m} (total rotations)

A ball screw's service life is obtained from the following equation using the basic dynamic load rating and applied axial load.

$$L_{10m} = \left(\frac{C_a}{f_w \cdot F_a} \right)^3 \times 10^6$$

L_{10m} : Modified nominal life (total rotations) (rev)
 C_a : Basic dynamic load rating* (kN)
 F_a : Applied axial load (kN)
 f_w : Load factor

Load Factor (f_w)

Vibration/Impacts	Speed (V)	f_w
Minute	Under minute speeds $V \leq 0.25$ m/s	1.0 to 1.2
Low	Under low speeds 0.25 m/s < $V \leq 1.0$ m/s	1.2 to 1.5
Medium	Under medium speeds 1.0 m/s < $V \leq 2.0$ m/s	1.5 to 2.0
High	Under high speeds 2.0 m/s < V	2.0 to 3.5

*The nominal life is obtained by calculating the load on the premise that the product is set up in ideal mounting conditions with the assurance of good lubrication. The service life can be affected by the precision of the mounting materials used and any distortion.

Service Life in Hours L_h

Once the nominal life (L_{10m}) has been obtained, the service life in hours (L_h) can be calculated using the following formula if the stroke length and the number of cycles are constant.

$$L_h = \frac{L_{10m} \times Ph}{2 \times \ell_s \times n \times 60}$$

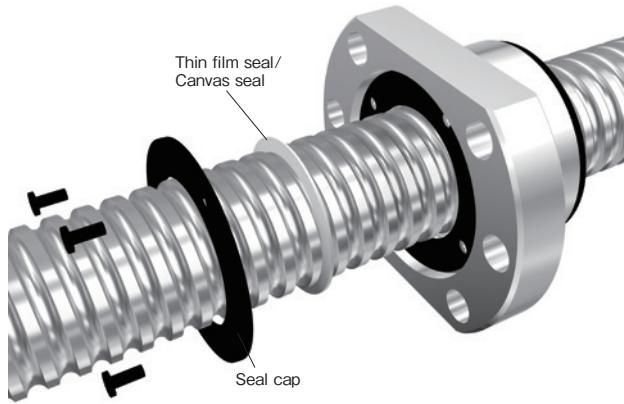

L_h : Service life in hours (h)
 ℓ_s : Stroke length (mm)
 n : Number of cycles per minute (min⁻¹)
 Ph : Lead (mm)

Contamination Protection

If foreign materials enter the ball screw, they may lead to abnormal wear and ball jamming, which could shorten the life of the product. Therefore, it is necessary to prevent foreign material from entering the product. If it is likely that foreign materials will get inside, it is important to select an effective contamination protection device suited to the conditions in which it will be used.

Thin Film Seal (TT)

Thin film seals protect against foreign impurities and lubricant discharge through direct contact. They have low sliding resistance and generate little heat.

Canvas Seal (CC)

Canvas seals prevent foreign material from entering the nut through elastic contact with the outer diameter of the ball screw shaft and the groove. In addition to exceptional performance at preventing contamination and retaining grease, they are made from resin with high slidability and therefore generate little heat. They are used when higher levels of contamination protection are needed.

*Canvas seals are only compatible with $\phi 14$ to $\phi 50$.

*When canvas seals are applied, the overall nut length may become longer.

*For dimensions after applying dust-proofing seals, see p. 17.

Standard Grease

THK Original Grease AFJ

AFJ grease uses refined mineral oil as its base and has a urea-based consistency enhancer and other special additives that give it excellent lubrication properties at a wide range of speeds from low to high.

*The $\phi 10$ is filled with lithium-based grease No.2 (Multemp PS-2 grease) as standard.

*Non-standard greases are also available. Please contact THK.

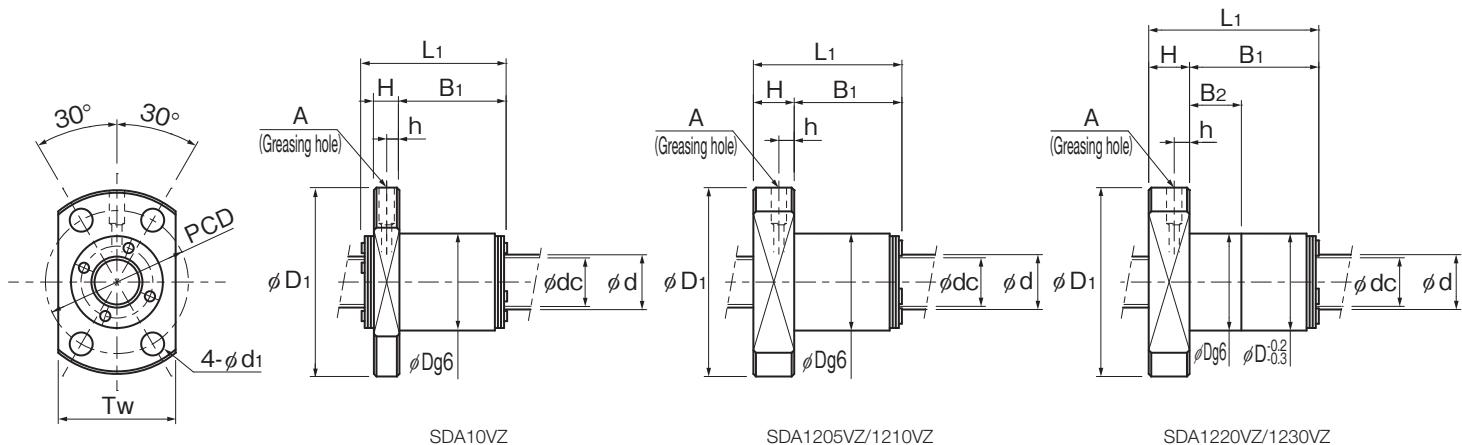

Representative physical properties

Item	Representative physical property	Testing method
Consistency enhancer	Urea-based	
Base oil	Refined mineral oil	
Base oil kinematic viscosity: mm ² /s (40°C)	20	JIS K 2220 23
Worked penetration (25°C, 60 W)	325	JIS K 2220 7
Mixing stability (100,000 W)	360	JIS K 2220 15
Dropping point: °C	185	JIS K 2220 8
Evaporation volume: mass% (99°C, 22 h)	0.6	JIS K 2220 10
Oil separation rate: mass% (100°C, 24 h)	7.0	JIS K 2220 11
Copper plate corrosion (B method, 100°C, 24 h)	Passed	JIS K 2220 9
Low-temperature torque mN·m (-20°C)	Starting 38 Rotational 13	JIS K 2220 18
4-ball testing (welding load): N	3089	ASTM D2596
Operating temperature range: °C	-20 to 120	
Color	Yellowish brown

Note) The groove on the screw shaft cannot be cut on both ends. Contact THK if you require such a design.

The rigidity values (K) in the table represent spring constants, each obtained from the load and the elastic deformation under an axial load equal to 30% of the basic axial dynamic load rating (Ca).

These values do not include the rigidity of the components related to mounting the ball screw nut. Therefore, it is generally appropriate to regard roughly 80% of the rigidity value (K) in the table as the actual value.

If the axial load (Fa) is not 0.3 Ca, the rigidity value (K_N) is obtained from the following equation.

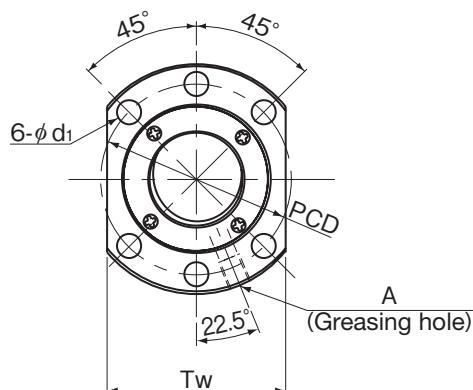

$$K_N = K \left(\frac{Fa}{0.3Ca} \right)^{\frac{1}{3}}$$

K: Rigidity value in the specification table

Note) The groove on the screw shaft cannot be cut on both ends. Contact THK if you require such a design.

The rigidity values (K) in the table represent spring constants, each obtained from the load and the elastic deformation under an axial load equal to 30% of the basic axial dynamic load rating (Ca).

These values do not include the rigidity of the components related to mounting the ball screw nut. Therefore, it is generally appropriate to regard roughly 80% of the rigidity value (K) in the table as the actual value.

If the axial load (Fa) is not 0.3 Ca, the rigidity value (K_N) is obtained from the following equation.

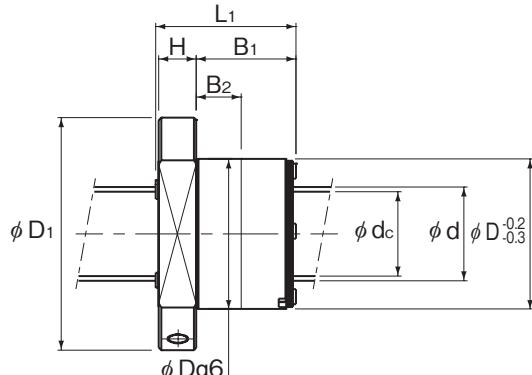

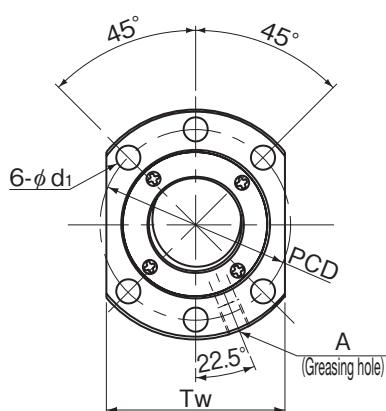

$$K_N = K \left(\frac{Fa}{0.3Ca} \right)^{\frac{1}{3}}$$

K: Rigidity value in the specification table

Note) The groove on the screw shaft cannot be cut on both ends. Contact THK if you require such a design.

The rigidity values in the table represent spring constants, each obtained from the load and the elastic deformation when providing a preload equal to 10% of the basic axial dynamic load rating (Ca) and applying an axial load three times greater than the preload.

These values do not include the rigidity of the components related to mounting the ball screw nut. Therefore, it is normally appropriate to regard roughly 80% of the value in the table as the actual value.

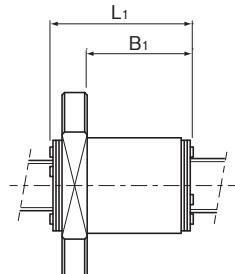

If the applied preload (F_{a0}) is not 0.1 Ca, the rigidity value (K_N) is obtained from the following equation.

$$K_N = K \left(\frac{F_{a0}}{0.1Ca} \right)^{\frac{1}{3}}$$

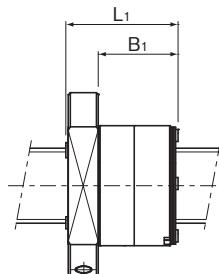

K: Rigidity value in the specification table

Handling

- (1) Please use at least two people to move any product weighing 20 kg or more, or use a cart or another method of conveyance. Otherwise, it may cause injury or damage the unit.
- (2) Do not disassemble the parts. This will result in loss of functionality.
- (3) Tilting the screw shaft and nut may cause them to fall under their own weight.
- (4) Take care not to drop or strike this product. Otherwise, it may cause injury or damage the unit. Even if there is no outward indication of damage, a sudden impact could prevent the unit from functioning properly.
- (5) When assembling, be sure not to remove the nut from the screw shaft.
- (6) Wear appropriate safety gear, such as protective gloves and safety shoes, when handling the product.

Precautions on Use

- (1) Prevent foreign materials, such as cutting chips or coolant, from entering the product. Failure to do so could damage the product.
- (2) Prevent foreign materials, such as cutting chips, coolant, corrosive solvents, or water from getting in the product by using a bellows or cover when the product is used in an environment where such a thing is likely.
- (3) Do not use this product if the external temperature exceeds 80°C. If used above this temperature, there is a risk that the resin and rubber parts may deform or become damaged (except for the heat-resistant type).
- (4) If foreign materials such as cutting chips adhere to the product, replenish the lubricant after washing the product.
- (5) Slight oscillations can inhibit the formation of an oil film between the raceways and the area of contact for the balls, resulting in fretting. Therefore, be sure to use a type of grease with high fretting resistance. We recommend periodically rotating the nut once to help ensure that a film forms between the raceways and balls.
- (6) Do not forcibly drive a pin, key, or any other positioning device into the product. This could create indentations in the raceways and impair the product's function.
- (7) Skewing or misalignment of the nut and the element that supports the shaft can drastically reduce service life. Inspect the components carefully and make sure they are mounted correctly.
- (8) If any balls fall out of the nut, contact THK. Do not use the product in that condition.
- (9) If the unit will be mounted vertically, install safety equipment or take other measures to prevent it from falling. The nut may fall under its own weight.
- (10) Do not exceed the permissible rotation speed when using the product. This could damage the product or otherwise cause it to malfunction. Please use the product within the range of speeds we have specified.
- (11) Do not allow the nut to overshoot. The product may malfunction if any of the balls fall out, the circulation components become damaged, or any indentations form in the ball raceways. Continuing to use the product under these circumstances may lead to premature wear or damage to the circulation components.
- (12) Use ball screws in conjunction with guide elements such as an LM Guide or ball spline. Failure to do so could damage the product.
- (13) Insufficient rigidity or accuracy of the mounting surface could cause an unexpected load to act on the ball screw, which could lead to premature failure of the product. Therefore, give sufficient consideration to the rigidity and accuracy of the housing and base.

Lubrication

- (1) Thoroughly wipe off anti-rust oil and feed lubricant before using the product.
- (2) Do not mix different lubricants. Even grease containing the same type of thickening agent may, if mixed, interact negatively due to disparate additives or other ingredients.
- (3) When using the product in locations exposed to constant vibrations or in special environments such as in clean rooms, vacuums, and low/high temperatures, use a lubricant suitable for its use/environment.
- (4) When lubricating products that do not feature a grease nipple or oil hole, directly coat the raceways with lubricant and perform several warm-up strokes to ensure that the grease permeates the interior.
- (5) Grease viscosity can vary depending on the temperature. Please keep in mind that the torque of the ball screw may be affected by changes in viscosity.
- (6) After lubrication, the rotational torque of the ball screw may increase due to the stirring resistance of the grease. Be sure to perform a warming-up operation and allow the grease to break in sufficiently before operating the machinery.
- (7) Excess grease may spatter after lubrication. Wipe off spattered grease as necessary.
- (8) Grease deteriorates over time, which decreases the lubricity. Perform regular grease inspections and replenish grease based on frequency of use.
- (9) The greasing interval varies depending on the usage conditions and environment. Grease the system approximately every 100 km of travel distance (3 to 6 months). The final greasing interval/amount should be set at the actual machine.
- (10) Depending on the mounting orientation and nut lubrication port position, the lubricant may not circulate sufficiently. Take note of this during the design process.
- (11) It is necessary to provide adequate lubrication when using ball screws. Using the product without lubrication may increase wear on the rolling elements and shorten the service life.

Storage

When storing the ball screw, pack it as designated by THK and store it indoors in a horizontal position away from high or low temperatures and high humidity. Please note that if the product has been kept in storage for an extended period, the lubricant inside may have deteriorated. Please ensure that you replenish the lubricant before using.

Disposal

The product should be treated as industrial waste and disposed of appropriately.

High-Speed, Compact Ball Screw Semi-custom SDA-VZ

- The nut dimensions comply with ISO, DIN, and JIS standards.
- Select stroke length in units of 1 mm.
- The shaft end shape and support unit can be selected.
- Eight products are available with a combination of shaft diameters from $\phi 15$ to $\phi 25$ and leads from 5 mm to 20 mm.

Fast delivery products

High-Speed, Compact Caged Ball Screw SDA-V/SDAN-V
