

Ventmaster Kiln Fume Ventilation System

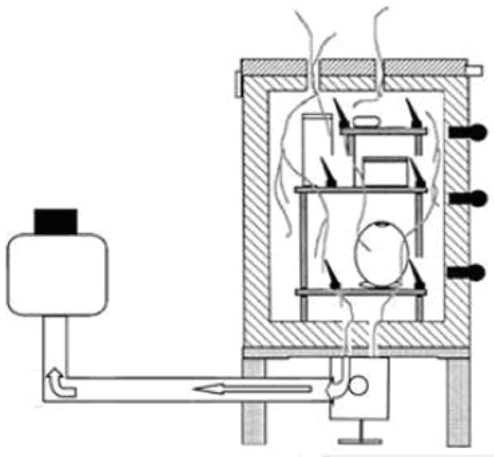

Featuring:

The VentMaster fume extraction system by Orton Ceramics works by creating a small downdraft within the Kiln, the chamber is kept at a slight negative pressure. Gases and Fumes are pulled out of the bottom of the Kiln, through a small hole, mixed with fresh room air and then exhausted to the outside through a 100mm duct.

The system gives the following benefits:

- Fume removal improves firings and ensures smells are removed from the room.
- Extends life of elements by removing moisture.
- Can aid in cooling of the Kiln in certain conditions
- Improves Temperature uniformity in the chamber.

Woodrow Kilns is only factory so needs to be ordered with the Kiln.

The unit sits within the footprint of most Kilns and ducts to the rear of the Kiln.

Simply install a 100mm duct from PVC pipe or aircon ducting to the outside and all your annoying smells and corrosive fumes will be taken care of.
