

Magnitone reduces the incidence of blackheads and breakouts

Study Objective

The aim of the study is the evaluation of a facial cleansing brush based on subjective assessment by the volunteers in a home-use study using a questionnaire over a period of 4 weeks.

Methodology

51 females took part in the study. Test items was used daily by the 51 volunteers at home. Each volunteer used the test item over a period of 4 weeks.

Volunteers used a 1-5 level scale to answer questionnaires at 5 points during the test: before usage, directly after first use, after 7 days, after 14 days and after 28 days.

Results

After using Magnitone for a month 90% of users said the appearance of black heads had improved.

90% experienced reduction in black heads
