## 50W/75W/100W, wide input voltage, isolated &regulated single output DC-DC converter

Patent Protection RoHS

## FEATURES

- Wide range of input voltage : 66-160V
- Efficiency up to 92%
- Low no-load power
- Isolation voltage 3000VDC
- Operating temperature range:-40°C~+100°C
- Input under-voltage protection, output over-voltage, over-current, short circuit, over-temperature protection
- International standard: 1/4 brick
- Meets requirements of UL60950 and railway standard EN50155

URF1D\_QB Series is a high performance product designed for the field of railway applications. Output power contains 50W/75W/100W, no min. load requirement, wide input voltage 66-160VDC, which allows the base plate temperature up to 100 °C. Further product feathers include input under-voltage protection, output over-voltage protection, short circuit protection, over temperature protection, remote control and compensated, output voltage regulation functions. Meets the EN50155 railway standard and UL/EN60950 safety standards, Widely used in the railway system and associated equipment.

## Sense of application and precautions

### 1. When Remote Sense is not used

#### Notes:

- 1) When remote sense is not used, make sure + Vo and Sense + are shorted, and that OV and Sense- are shorted as well;
- 2) Keep the patterns between + Vo and Sense + and OV and Sense- as short as possible. Avoid a looping pattern. If noise enters the loop, the operation of the power module will become unstable.

### 2. When Remote Sense is used

#### Notes:

- 1. Using remote sense with long wires may cause output voltage to become unstable. Consult us if long sensing wiring is necessary.
- 2. Sense patterns or wires should be as short as possible. If wires are used, use either twisted-pair or shielded wires.
- 3. Please Use wide PCB trace or a thick wires between the power supply module and the load, the line voltage drop should be kept less than 0.3V. Make sure the power supply module's output voltage remains within the specified range.
- 4. The impedance of wires may cause the output the voltage oscillation or have a greater ripple, please do adequate assessments before using.

## **Design Reference**

## 1. Ripple & noise

All the URF1D\_QB-100W series have been tested according to the following recommended test circuit before leaving the factory (see Figure 1).

### 2. Typical application

If don't use our company's EMC models, please make sure the input of at least 33uF electrolytic capacitor in parallel to suppress the input terminal may produce surge voltage.

If it is required to further reduce input and output ripple, properly increase the input & output of additional capacitors Cin and Cout or select capacitors of low equivalent impedance provided that the capacitance is no larger than the max. capacitive load of the product.

| Capacitive<br>Parameter<br>Output Voltage | Cout(µF) | Cin(µF) |
|---|----------|---------|
| 24V                                       | 220      | 100     |

## 3. EMC solution-module recommended circuit

## 4. These applications are not supported for the follow models

#### 5. Thermal design

The maximum operating temperature of base- plate TB is 100  $^{\circ}$ C, as long as the user's thermal system keeps TB <100  $^{\circ}$ C, the converter can deliver its full rated power. A power derating curve can be calculated for any heatsink that is attached to the base-plate of the converter. It is only necessary to determine the thermal resistance, Rth(B-A), of the chosen heatsink between the base-plate and the ambient air for a given airflow rate. This information is usually available from the heatsink vendor. The following formula can the be used to determine the maximum power the converter can dissipate for a given thermal condition if its base-plate is to be no higher than 100  $^{\circ}$ C.

$$P_{diss}^{\max} = \frac{100 \text{ C} - T_{\text{A}}}{R \text{th}} \quad \text{(B - A)} \quad \text{(T_{\text{A}} is ambient temperature)}$$

10000 0

The maximum load operating power of power supply module at a certain ambient temperature can be calculated by the power dissipation, Formula is as follows:

$$Po_{\max} = \frac{P_{diss}^{\max}}{(\frac{1}{\eta} - 1)} \qquad (\eta_{\text{ is converter efficiency}})$$

Therefore, customers can according to the actual application to choose the right heatsink.

#### 6. Application of Trim and calculation of Trim resistance

Applied circuits of Trim (Part in broken line is the interior of models)

Calculation formula of Trim resistance:

| up: Rt=   | aR2<br>R2-a -R3 | $a = \frac{Vref}{Vo'-Vref} \cdot R_1$   |
|-----------|-----------------|---|
| down: RT= | aR1<br>R1-a -R3 | $a = \frac{Vo' - Vref}{Vref} \cdot R_2$ |

Note: Value for R1, R2, R3, and V<sub>ref</sub> refer to the above table 1. R<sub>1</sub>: Resistance of Trim. a: User-defined parameter, no actual meanings. Vo': The trim up/down voltage.

| table 1         |         |  |  |  |
|-----------------|---------|--|--|--|
| Vo<br>Parameter | 24(VDC) |  |  |  |
| R1(KΩ)          | 24.87   |  |  |  |
| <b>R2(K</b> Ω)  | 2.87    |  |  |  |
| <b>R3(K</b> Ω)  | 20      |  |  |  |
| Vref(V)         | 2.5     |  |  |  |

- 7. The product does not support in parallel and hot-plug use
- 8. For more information please find the application notes on www.mornsun-power.com

#### Note

- 1. Packing Information please refer to 'Product Packing Information'. Packing bag number:58010113(without heatsink), 58010112(with heatsink);
- 2. Recommended used in more than 5% load, if the load is lower than 5%, then the ripple index of the product may exceed the specification, but does not affect the reliability of the product;
- 3. The max capacitive load should be tested within the input voltage range and under full load conditions;
- 4. If the customer tests EMC, suggest to take our EMC module FC-CX3D. If the customer needs to meet the performance aspects of the surge, and don't take our EMC module FC-CX3D, please make sure the surge residual voltage less than 180V, to ensure the reliability of the product;
- 5. Recommends that customers plus silicone film or thermal grease between the module and the heatsink, In order to ensure good heat dissipation;
- 6. Unless otherwise specified, data in this datasheet should be tested under the conditions of Ta=25°C, humidity<75% when inputting nominal voltage and outputting rated load;
- 7. All index testing methods in this datasheet are based on our Company's corporate standards;
- 8. The performance indexes of the product models listed in this datasheet are as above, but some indexes of non-standard model products will exceed the above-mentioned requirements, and please directly contact our technicians for specific information;
- 9. We can provide product customization service;
- 10.Specifications of this product are subject to changes without prior notice.
