

Planting

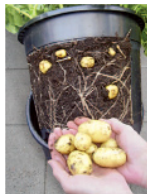

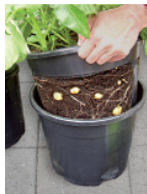

- Plant three seed potatoes in inner pot, preferably in peat moss
- Locate them in center of pot, mid height, leaving some space in between them
- Insert inner pot into outer pot and water thoroughly

Care

- Water regularly, preferably daily. Fertilize occasionally
- Place in warm and bright location
- Cover pot with plastic sheet or plexiglass until potatoes sprout
- Alternately, pre-sprout potatoes, which shortens harvesting time by 2 weeks: in February place seed potatoes in bright natural light at about 68F, let sprout
- Starting with your plant inside is okay, but move pot outdoors once potatoes sprout

**At any time lift the inner pot out of the outer pot and monitor the progress of your potatoes!
Start harvesting after 8 to 10 weeks.**

- To harvest in mid-May, plant in mid-March, to harvest in early June, plant in early April
- New potatoes will grow until first frost
- Trim lanky plants down to 10"
