

# FAUCET FILTER INSTALLATION INSTRUCTIONS

## WHAT'S THIS FOR?

These instructions tell you how to quickly install and start enjoying your new *Advanced Tap Water Faucet Filter*. The filter installs quickly and easily on any standard kitchen or bathroom faucet. Filter cartridges last for about 1,500 gallons. Keep water temperature between 40-110°F (or 5-45°C).

## TOOLS REQUIRED:

- Channel Locks (optional)

## STEP 1: REMOVE ADAPTERS FROM FILTERS

Faucet filter may come with the threaded adapter or the white plastic screw-adjustment adapter already attached. Neither adapter is needed for faucets in the U.S. If attached, twist off the adapter. (If your faucet requires an adapter, select the one that is most appropriate and attach to the filter.)

## STEP 2: REMOVE FAUCET AERATOR

At the end of the faucet is a small cap containing a mesh screen called the faucet aerator. Remove the faucet aerator from the faucet by turning clockwise (save it for later use). Untwisting can usually be done by hand, but you may need a pair of channel locks if the aerator is on too tight.

## STEP 3: TWIST FILTER ON TO FAUCET

Align the filter up with the faucet, and twist the filter connection by turning counterclockwise. You can get a leak-proof fit just by tightening by hand. Tools are not required (or recommended). After installing, the faucet filter can swivel around the faucet to the desired orientation.

## STEP 4: FLUSH FAUCET FILTER CARTRIDGE

With the water on, turn the filter knob out 90° to direct water flow through the filter. Flush for 20 seconds to remove excess carbon particles from the new filter. This results in black water for the first few seconds. After flushing, you can now enjoy the clean water from your new faucet filter!

# FILTER CARTRIDGE REPLACEMENT INSTRUCTIONS

## WHAT'S THIS FOR?

These instructions tell you how to change out the filter cartridge for your *Advanced Tap Water Faucet Filter*. The filter installs easily on any standard kitchen or bathroom faucet. Filter cartridges last for about 4 months or 1,500 gallons. Keep water temperature between 40-110°F (or 5-45°C).

## TOOLS REQUIRED:

- None

## STEP 1: UNSCREW FILTER HOUSING

First, unscrew the housing that contains the filter cartridge for your faucet filter. This simply involves turning the housing counterclockwise until it completely unscrews from the filter base that attaches to your faucet. Unscrewing can be done by hand with no tools required.

## STEP 2: SWAP FILTER CARTRIDGES

With the filter housing removed, take out the old filter cartridge and throw it away. Place the new filter cartridge in its place. The ridges at the bottom of the filter cartridge should fit snugly over the ridges of the filter base.

## STEP 3: SCREW FILTER HOUSING BACK ON

With the new cartridge in place, twist the filter housing back onto the filter base by turning clockwise. You can get a leak-proof fit just by tightening by hand. Tools are not required (or recommended).

## STEP 4: FLUSH FAUCET FILTER CARTRIDGE

Finally, turn the water on to flush out excess carbon particles from the new filter cartridge. This results in black water for the first few seconds. Keep flushing for 20 seconds or until the water becomes clear. You can now enjoy your faucet filter for another 4 months!
