

## SHOWER HEAD INSTALLATION INSTRUCTIONS

### WHAT'S THIS FOR?

These instructions tell you how to quickly install and start enjoying your new *Aqua Elegante* Handheld Shower Head. The handheld shower head installs quickly and easily on any standard ½" threaded shower hose (the universal size in the US and UK) and mounts on a shower bracket.

### TOOLS REQUIRED:

- Teflon Tape (included)
- Paperclip (optional)
- Scissors (optional)
- Wrench (optional)

### STEP 1: PREPARE TO INSTALL

If you wish to remove the flow restrictor, do so now. (See instructions on back.) If you already have a handheld shower head, remove it from your shower hose and skip to Step 4. If not, remove your old shower head from the shower arm. (Use a wrench if it is on too tight.)

### STEP 2: INSTALL SHOWER BRACKET

Clean any debris that may be present on the threaded pipe (like old Teflon tape). Next, wrap 4-6 full turns of the included Teflon tape tightly around the clean shower arm threads. Use scissors if you want a clean break in the Teflon tape. Then twist the shower bracket onto the shower arm.

### STEP 3: INSTALL SHOWER HOSE

If your hose comes with rubber gaskets, put them in the shower hose connections. Wrap 3-5 full turns of Teflon tape around the threads of the shower bracket. Then twist the shorter, thicker connection of the shower hose on the shower arm. You can use a wrench to tighten further.

### STEP 4: TWIST ON NEW HANDHELD SHOWER HEAD

Wrap 4-6 full turns of Teflon tape around the threads of your new *Aqua Elegante* handheld shower head. Twist the longer, thinner connection of the hose to your new handheld shower head. Check for leaks and tighten as needed. You can then mount the shower head in the shower bracket.

## FLOW RESTRICTOR REMOVAL INSTRUCTIONS

### WHAT'S THIS FOR?

Flow restrictors are small devices in your shower head that restrict water flow as mandated by U.S. federal regulations to help conserve water. Users with low water pressure, however, can remove the flow restrictors in their shower heads to achieve higher flow rates.

### TOOLS REQUIRED:

- Paperclip
- Course-Thread Screw
- Screwdriver
- Pencil Eraser (optional)

### STEP 1: REMOVE THE O-RING

Look at the bottom of your handheld shower head, and you will see the white plastic flow restrictor in the throat of the shower head. On top of the flow restrictor sits a small black o-ring. Simply remove the black o-ring using a paper clip to expose the 4 holes in the restrictor.

### STEP 2: REMOVE THE FLOW RESTRICTOR

The flow restrictor is usually installed too tightly to remove with just a paperclip. With the screwdriver, screw the tip of a coarse-threaded screw (like a drywall screw) into one of the larger holes. (One full turn is typically enough.) Pull firmly on the screw to pop out the flow restrictor.

### EXTRA: REINSTALLING THE FLOW RESTRICTOR

You should store the flow restrictor in a safe place just in case you want to reinstall it. (If you lose your flow restrictor, message us for a new one.) To reinstall, push the flow restrictor back in place. You can push it with a blunt tip like a pencil eraser to ensure it goes in place.
