

## **IMPORTANT ROUTER INFORMATION**

An internet connection is not necessary to run the K5 Series WiFi lights. All that is needed is a router to act as a communication hub between your computer/device and your light. When setting up your XL Series WiFi lights, it is recommended that a dedicated router be used with any setup using 4 or more lights.

"Out of the box", mid-tier routers can be used for any rooms running 15 lights or less. For any facilities running more than 15 lights, it is recommended that a more robust network be setup. A quick internet search for "WiFi network solutions in your area" should bring up a number of providers that help assist with your specific network setup, which will be based on the total number of lights and room configurations.

Please note that larger setups will have other factors that may affect communication such as EMI interference from other devices, racking, room layout, building materials, etc. Your local WiFi network solutions company will also assist in configuring your network to account for these factors.

### **Suggested Mid-Tier Routers:**
