

7 Amazing Benefits of a

Floating Pond Fountain

Do you own or are you the caretaker of property that includes a lake or pond? Are you looking to enhance its appeal and enhance water quality? A pond fountain can be a great addition to your body of water. Many floating pond fountains on the market offer versatile features. You can use them as a centerpiece of your landscape or to accent other elements.

Check out these 7 Amazing Benefits of Floating

1 Improves Water Quality

One of the main benefits of getting a floating pond fountain is the improved water quality. Improved water quality comes from the oxygenation process. A floating pond fountain would be best for ponds and shallow lakes. By pumping water into the air, not only do you create pleasing visuals to enjoy, it also promotes **surface aeration** and transfers oxygen to the surface. Water that splashes back into the water full of oxygen and allows submerged gases to escape.

2 Eliminates Foul Odor

The top layers absorbs more light and warmth and has less organic matter. However, this means that there's also less oxygen working to break down bacteria. Most organic matter falls to the lower layers or all the way to the bottom of your pond or lake. This process forces water from the bottom layer to the top. The turnover process leads to excessive emission of foul gas. This is where having a floating pond fountain aeration system helps out.

3 Control Algae Growth

If you maintain a pond or a lake, one of your main issues may be **excessive algae growth**. Algae is normal, but too much can deplete oxygen and therefore harm the ecosystem. First, it's essential to understand algae growth. Algae can grow overnight and thrive off the water, sunlight, and carbon dioxide. They also rely on inorganic nutrients present in your water. Algae often bloom if you have excessive nutrients in your pond.

4 Healthier Habitat for Fish

The enhanced oxygen circulation promotes a healthier habitat for your fish. Aeration ensures that oxygen flows through your ecosystem. This allows your fish to thrive on the surface and underneath it. This expands the living space of your fishes and other aquatic organisms in your pond. Aeration systems are best for warm water fish that struggle without enough oxygen. This includes fishes like bass and catfish.

5 Fix Your Mosquito Problem

Mosquitoes thrive on stagnant water. A floating pond fountain or aeration pump will help you promote motion and oxygen in the water. The reduced algae growth also offers an indirect solution to your problem. When mosquito larvae hatch, they often feed on algae to boost their growth. As we mentioned previously, an aeration system allows you to reduce algae growth. This eliminates their food supply and allows you to keep your pond clean. It's also best to trim vegetation surrounding your pond.

6 Reduce Nutrients in Bottom Sediment

Excessive nutrients in the bottom sediment of your pond can harm your body of water. It promotes the growth of algae and can kill your ecosystem. Low oxygen levels can kill your plants and fish, especially during the turnover season. Accumulation in the bottom sediment can also cause the need for a dredging session.

This is often a messy, expensive, and time-consuming process.

7 Beneficial During Winter

During the autumn season, your pond will start to load up on more organic material. If you allow this to happen, you put your fishes' lives at risk and welcome foul odor into your pond. An aeration system circulates this and will offer you a big advantage in the next season.

An aeration system or fountain also prevents ice formation. Open water can attract more wildlife, like waterfowl. This also allows toxic gases to escape from your pond instead of getting trapped under ice.

Why You Need a Floating Pond Fountain

Now that we have show you these seven benefits of getting a floating pond fountain in place, you can start narrowing down which option would be best for you. Do you think your pond or lake needs a boost? We are here to help you maximize the health and beauty of your lake or pond.

If you're looking for a floating pond fountain as part of your pond for aeration system, We offer some of the **best pond fountains for sale** as well as other premium aeration solutions.
