

The Best Ways to Care for Your Water Trampoline

Coming up with new summer activities is always a challenge. Your kids always want something new, but there are only so many ways you can make playing on the water exciting.

Water trampolines are an excellent solution. They're simple and intuitive, but they give your kids (and even the adults) hours of fun!

Thinking of getting a water trampoline for your next summer vacation? Keep reading to learn everything you need to know.

What Is a Water Trampoline?

A water trampoline is like a traditional trampoline, with a stretchy center mat and springs. The key difference is that instead of being attached to legs that are anchored in the ground, a water trampoline is attached to an inflated device. This device is made from a thick plastic substance, usually PVC or vinyl.

Much like traditional trampolines, there are lots of options for you to choose from. The trampolines range in size, the amount of weight they can support, colors, shapes, and more.

There are also smaller floating trampolines that are great for your swimming pool. You can also get a water trampoline for a lake, river, and more! It all depends on what you want to use it for.

How To Keep Your Water Trampoline in Good Condition

Keeping your water trampoline in a good condition is vital to extending its lifespan. They can last between 7 and 10 years when they are looked after properly. But without the right care, they degrade fast.

Clean Trampoline Regularly

Regardless of the [body of water](#), it's going to have substances that become harmful to the trampoline. The water exposure alone leads to rust on the metal frame and springs.

Other materials like fungus, bacteria, dirt, or general grime and grease all build up and damage the trampoline. And while small amounts of exposure aren't too dangerous, it adds up over time.

Prolong the life of your water trampoline with regular cleaning. The soap from the cleaning products removes these harmful substances, extending the amount of time before the trampoline is damaged.

Don't use a power washer when cleaning your trampoline. The force of these washers can damage the material of the airbag.

Check the Mat

The mat is the stretchy black part of the trampoline. To keep this in good condition, it's important to keep it clean.

You don't want to use anything with strong chemicals that corrode the material. Use soft brushes or sponges and soapy

water.

Make sure you remove dirt from underneath the mat, otherwise it can still get damaged from that side. When you're under the mat, also check the connecting cords to ensure they're in good condition.

The connecting cords are the material parts that connect to the frame. These are important for keeping the mat secured to the rest of the trampoline. Always make sure they are all there and in good condition, and replace any that seem damaged.

Check the Springs

The springs are most likely to get damaged by long-term exposure to water. The metal of the [springs can rust](#), causing their structural integrity to fail. While one broken spring is usually fine, a few become a problem.

As soon as you notice a problem with a spring, replace it. And keep an eye on the others, because once one fails, there's a good chance the others will fail soon too.

Check the Inflatable Tubes

The most exciting part of the water trampoline is that it can float! So keeping the inflatable tubes intact is vital.

Long-term exposure to the sun and substances in the water can damage the airbag. Other damages can come from cuts or scratches from the environment.

Always be careful when moving the water trampoline. Make sure you've got a few people around to keep it off the ground. This way you avoid catching it on small stones which might puncture it.

Keep an eye on the air pressure of the inflatable tubes. It should stay the same firmness for at least a day. If not, then look for punctures and patch them up immediately.

Storage

When the water trampoline is not being used, pack it away if possible. It's best to keep it out of sunlight and out of the water. It's also wise to deflate the airbag, but this isn't necessary if you're going to use it again in the next day or so.

Another option would be to get a cover for your water trampoline. This will keep it debris-free and clean so that it is ready for your next use. It will also keep the sun's damaging ultraviolet rays from harming your water trampoline.

When you leave the water trampoline out in the sun and on the water, the materials get damaged faster. And as they get damaged, the trampoline becomes unsafe.

For an added measure, it's best to clean it off before storing it away. This removes any harmful substances from the water which will degrade the material of the trampoline.

Benefits of a Water Trampoline

Water trampolines are a great way to make being out on the water more exciting. They take two activities most people are already familiar with - being on the water, and trampolining - and combine them!

Water trampolines unlock new game ideas and creativity for your kids in the summer. If you get a big enough one, the adults

can even participate!

Compared to some other water-related activities, this one is also relatively safe. It doesn't have the same speed involved that a lot of boat-related activities have, and it can be anchored close to shore.

If you don't want to make a long-term investment, you can even look into a water trampoline rental while you're on vacation. Then you don't have to worry about the long-term maintenance or investment.

Enjoy a Water Trampoline This Summer

Add some excitement to your next summer vacation with a water trampoline. If you look after your water trampoline, you'll be able to use it for years to come.

Remember to follow proper safety procedures. With this equipment, you and your family will unlock new levels of fun the next time you're out on the water. Get a water trampoline today!
