

Flat Thongs Not Giving You Enough Support?

Elevated heel section - May help reduce load on Calf and Achilles.

Heel cup - May help support the foot in a more bio-mechanically appropriate position.

Up to 2.2 cm of orthotic support - A similar amount to that found in most off-the-shelf orthotics. This may help to reduce the stresses and strain on your feet and lower limbs.

Toe star - reduces foot slippage

Extremely light weight and super comfortable memory foam reduces the workload of the feet which is great for post exercise recovery.

Tighter strap causes thong to stick to your feet which enables a more natural gait, reducing toe clawing and potential tendon overuse.

One-piece construction (no plugs) - reduces the likelihood of a blowout / snapped strap & soft foam reduces friction between toes which may help decrease blisters.
