

# Information on Volatile Organic Compounds

Grain Wood Furniture

Volatile Organic Compounds (VOCs) are organic chemicals characterized by high volatility. They are present in many organic materials including dyes and scents. Many man-made products emit some VOCs, but most VOCs do not present a particular danger to humans. Like many chemicals, some VOCs can be toxic at high concentrations or have long term health effects; However, the U.S. government regulates products with VOCs and ensures they fall below a safe standard. This means most consumers have no reason to worry about VOCs in their daily lives.

All products from Grain Wood Furniture are tested to be within the safe limits defined by government regulation. We are under constant contact with the products and their components - from their production to their warehousing - and are wary of any potential dangers related to long-term exposure. We are comforted by the fact that even the highest concentration chemicals are often thousands of times lower in concentration than their known safe-exposure limits. Interested customers can contact our support team to request product testing reports or for more information about VOCs or our product safety measures.
