

WHAT IS THE NUTRIENT?

Nitrogen- Used for vegetative growth of leaves, stems, etc. Forms chlorophyll, and helps build cell walls.

<u>Potash</u>-Strengthen plant roots and stems. Helps in ensuring plants use water efficiently.

<u>Calcium</u>- Needed for cell formation and development.

<u>Nitrogen-</u>Used for vegetative growth of leaves, stems, etc. Forms chlorophyll, and helps build cell walls.

<u>Potash-</u>Strengthen plant roots and stems. Helps in ensuring plants use water efficently.

<u>Magnesium-</u> Helps to form chlorophyll. Helps create oxygen through photosynthesis.

Molybdnum- Regulate all the other nutirents,

Nitrogen-Used for vegetative growth of leaves, stems, etc. Forms chlorophyll, and helps build cell walls.

<u>Magnesium</u>- Helps to form chlorophyll. Helps create oxygen through photosynthesis.

<u>Calcium</u>-Needed for cell formation and development.

Iron- Associated with energy. Helps form chlorophyll.

Phosphoric Acid - Is crutial to the development of flowers, fruit, seeds, and strong roots.

<u>Potash</u>- Strengthen plant roots and stems. Helps in ensuring plants use water efficiently.
