

EMC TEST REPORT

Applicant	:	Fogstar LTD
Address	:	Unit 11, Enfield Business Park,Enfield industrial estat, Redditch, B97 6DL, GB
Manufacturer	:	Shenzhen Evosen Technology Co., Ltd.
Address	:	Room 206, Unit 1, No. 1040-2 Longgang Avenue (Pingdi Section) Central Community Pingdi Street Longgang District Shenzhen
EUT	:	Lithium iron phosphate battery
Model No		DRIFT560
Brand Name:	:	Fogstar
Report Number		XK2305013080E
Test Date	:	May 18~23, 2023
Date of Issue	:	May 26, 2023
Test Result:	:	The equipment under test was found to be compliance with the requirements of the standards applied.
Test Procedure Use	d:	
		BS EN IEC 61000-6-3:2021
		BS EN IEC 61000-6-1:2019
:	:	BS EN 61000-3-3:2013+A2:2021+AC:2022
		BS EN IEC 61000-3-2:2019+A1:2021
		Prepared By: Shenzhen SiCT Technology Co., Ltd.

202, Building 3, No.111 Huanguan Middle Road, Songyuanxia Community, Guanhu Street,

Longhua District, Shenzhen, Guangdong, China

APPENDIX A - EUT PHOTOGRAPHS	

1 - GENERAL INFORMATION

1.1 Product Description for Equipment Under Test (EUT)

Client Information

Applicant:	Fogstar LTD
Address of applicant:	Unit 11, Enfield Business Park, Enfield industrial estat, Redditch, B97
	6DL, GB
Manufacturer:	Shenzhen Evosen Technology Co., Ltd.
Address of Manufacturer:	Room 206, Unit 1, No. 1040-2 Longgang Avenue (Pingdi Section)
	Central Community Pingdi Street Longgang District Shenzhen

General Description of E.U.T

EUT Name:	Lithium iron phosphate battery
Trade Mark:	Fogstar
Operating Mode.:	Mode 1: Power on
Model No:	DRIFT560
	DRIFT105, DRIFT230, DRIFT280, DRIFT300, DRIFT460,
Model(s):	DRIFTPRO280, DRIFTPRO300, DRIFTPRO460, DRIFTPRO560,
	DRIFT230SEATBASE
Power Supply:	Input:DC 12.8V

Remark: * The test data gathered are from the production sample provided by the manufacturer. * Supplementary models have the same circuit, but with different appearance.

1.2 Test Standards

The following Declaration of Conformity report of EUT is prepared in accordance with

BS EN IEC 61000-6-3:2021

BS EN IEC 61000-6-1:2019

BS EN IEC 61000-3-2:2019+A1:2021

BS EN 61000-3-3:2013+A2:2021+AC:2022

The objective of the manufacturer is to demonstrate compliance with the described standards above.

1.3 Test Summary

For the EUT described above. The standards used were BS EN 61000-6-3 Class B for Emissions & BS EN 61000-6-1 for Immunity.

Table 1 : Tests Carried Out Under BS EN IEC 61000-6-3:2021

Standard	Test Items	Status
BS EN IEC 61000-6-3:2021	Disturbance Voltage at The Mains Terminals (150KHz To 30MHz)	
	Radiated Disturbances (30MHz To 1000MHz)	\checkmark

 \checkmark Indicates that the test is applicable

 \times Indicates that the test is not applicable

Table 2 : Tests Carried Out Under BS EN IEC 61000-3-2:2019+A1:2021/ BS EN 61000-3-3:2013+A2:2021

Standard	Test Items	Status
BS EN IEC 61000-3-2:2019+A1:2021	Harmonic Current Test	×
BS EN IEC 61000-3-3:2013+A2:2021 AC:2022	Voltage Fluctuations and Flicker Test	×

 \checkmark Indicates that the test is applicable

× Indicates that the test is not applicable

Table 3 : Tests Carried Out Under BS EN IEC 61000-6-1:2019

Standard	Test Items	Status
EN 61000-4-2:2009	Electrostatic discharge Immunity	\checkmark
EN IEC 61000-4-3:2020	Radiated Susceptibility (80MHz to 1GHz)	\checkmark
EN 61000-4-4:2012	Electrical Fast Transient/Burst Immunity	×
EN 61000-4-5:2014+A1:2017	Surge Immunity	×
EN 61000-4-6:2014+AC:2015	Conducted Susceptibility (150kHz to 80MHz)	×
EN 61000-4-8: 2010	Power Frequency Magnetic Field Immunity (50/60Hz)	×
EN IEC 61000-4-11:2020/AC:2022	Voltage Dips, Short Interruptions Immunity	×

 \checkmark Indicates that the test is applicable

 \times Indicates that the test is not applicable

1.4 Test Methodology

All measurements contained in this report were conducted with CISPR 16-1-1: 2019, Radio disturbance and immunity measuring apparatus – Measuring apparatus, and CISPR 16-2-3: 2010, Method of measurement of disturbances and immunity.

1.5 Test Facility

Shenzhen SiCT Technology Co., Ltd.

202, Building 3, No.111 Huanguan Middle Road, Songyuanxia Community,Guanhu Street, Longhua District, Shenzhen,Guangdong, China

1.6 Test Equipment List and Details

1.7 DESCRIPTION OF TEST MODES

To investigate the maximum EMI emission characteristics generates from EUT, the test system was pre-scanning tested base on the consideration of following EUT operation mode or test configuration mode which possible have effect on EMI emission level. Each of these EUT operation mode(s) or test configuration mode(s) mentioned above was evaluated respectively.

Pretest Mode	Description
Mode 1	Power on
Mode 2	/

For Conducted Test			
Final Test Mode	Description		
Mode 1	Power on		
Mode 2	/		

For Radiated Test				
Final Test Mode	Description			
Mode 1	Power on			
Mode 2	/			

For EMS Test				
Final Test Mode Description				
Mode 1	Power on			
Mode 2	/			

2 - SYSTEM TEST CONFIGURATION

2.1 Justification

The system was configured for testing in a typical fashion (as normally used by a typical user).

2.2 EUT Exercise Software

The EUT exercising program used during radiated and conducted testing was designed to exercise the various system components in a manner similar to a typical use. The software offered by manufacture, can let the EUT being normal operation.

2.3 Special Accessories

Emission: The equipment under test (EUT) was configured to measure its highest possible radiation level. The test modes were adapted accordingly in reference to the Operating Instructions.

Immunity: The equipment under test (EUT) was configured to the representative operating mode and conditions.

2.4 Test Setup Diagram

2.5 General Description of Test Auxiliary

EUT Cable List and Details					
Cable Description	Length (m)	Shielded/Unshielded	With / Without Ferrite		
/		/			
/	/	/	/		
/	/	/	/		

3 - DISTURBANCE VOLTAGE AT THE MAINS TERMINALS

3.1 Measurement Uncertainty

All measurements involve certain levels of uncertainties, especially in field of EMC. The factors contributing to uncertainties are spectrum analyzer, cable loss, and LISN.

The Treatment of Uncertainty in EMC Measurements, the best estimate of the uncertainty of any conducted emissions measurement is 2.7 dB.

3.2 Limit of Disturbance Voltage At The Mains Terminals (Class B)

Fraguancy Panga (MHz)	Limits (dBuV)		
Trequency Range (Witz)	Quasi-Peak	Average	
0.150~0.500	66~56	56~46	
0.500~5.000	56	46	
5.000~30.00	60	50	

Note: (1) The tighter limit shall apply at the edge between two frequency bands.

3.3 EUT Setup

3.4 Instrument Setup

The test receiver was set with the following configurations:

Test Receiver Setting:

3.5 Test Procedure

During the conducted emission test, the EUT power cord was connected to the auxiliary outlet of the first Artificial Mains.

Maximizing procedure was performed on the six (6) highest emissions to ensure EUT compliance using all installation combination.

All data was recorded in the peak detection mode. Quasi-peak and Average readings were only performed when an emission was found to be marginal (within -10 dB μ V of specification limits). Quasi-peak readings are distinguished with a "**QP**". Average readings are distinguished with a "**AV**".

3.6 Summary of Test Results

According to the data in section 3.6, the EUT <u>complied with the EN 61000-6-3</u> Conducted margin, with the *worst* margin reading of:

3.7 Radiated Emissions Test Detail And Test Result

Conducted Emission Test

Passed

⊠ Not Applicable

Note: The EUT is DC supply, so this test item is not applicable.

4 - RADIATED DISTURBANCES

4.1 Measurement Uncertainty

All measurements involve certain levels of uncertainties, especially in field of EMC. The factors contributing to uncertainties are spectrum analyzer, cable loss, antenna factor calibration, antenna directivity, antenna factor variation with height, antenna phase center variation, antenna factor frequency interpolation, measurement distance variation, site imperfections, mismatch (average), and system repeatability.

The Treatment of Uncertainty in EMC Measurements, the best estimate of the uncertainty of a radiation emissions measurement is 4.5 dB.

4.2 Limit of Radiated Disturbances (Class B)

Frequency (MHz)	Distance (Meters)	Field Strengths Limits (dB μ V/m)	
30 ~ 230	3	40	
230 ~ 1000	3	47	

Note: (1) The tighter limit shall apply at the edge between two frequency bands.
(2) Distance refers to the distance in meters between the test instrument antenna and the closest point of any part of the E.U.T.

4.3 EUT Setup

The radiated emission tests were performed in the open area 3-meter test site, using the setup accordance with the CISPR 16-1-1:2019, CISPR16-2-3:2016+A1:2019. The specification used was EN 61000-6-3 Class B limits.

The EUT was placed on the center of the test table.

Maximum emission emitted from EUT was determined by manipulating the EUT, support equipment, interconnecting cables and varying the mode of operation and the levels in the final result of the test were recorded with the EUT running in the operating mode that maximum emission was emitted.

Block diagram of test setup (In chamber)

4.4 Test Receiver Setup

According to EN 61000-6-3 rules, the frequency was investigated from 30 to 1000 MHz. During the radiated emission test, the test receiver was set with the following configurations:

Test Receiver Setting:

Detector	Peak & Quasi-Peak
IF Band Width	120KHz
Frequency Range	
Turntable Rotated	0 to 360 degrees

Antenna Position:

Height	1m to 4m
Polărity	Horizontal and Vertical

4.5 Test Procedure

Maximizing procedure was performed on the highest emissions to ensure that the EUT complied with all installation combinations.

All data was recorded in the peak detection mode. Quasi-peak readings performed only when an emission was found to be marginal (within -10 dB µ V of specification limits), and are distinguished with a "**QP**" in the data table.

4.6 Corrected Amplitude & Margin Calculation

The Corrected Amplitude is calculated by adding the Antenna Factor and Cable Factor, and subtracting the Amplifier Gain from the Amplitude reading. The basic equation is as follows: Corr. Ampl. = Indicated Reading + Antenna Factor + Cable Factor - Amplifier Gain

The "Margin" column of the following data tables indicates the degree of compliance with the applicable limit. For example, a margin of 7dB μ V means the emission is 7dB μ V below the maximum limit for Class B. The equation for margin calculation is as follows:

Margin = Limit – Corr. Ampl.

4.7 Radiated Emissions Test Detail And Test Result

Radiated Emission Test Data of Below 1GHz

EUT:	Lithium iron phosphate battery	Model Name:	DRIFT560

5– HARMONIC CURRENT TEST

5.1 Application of Harmonic Current Emission

Compliance to these standards ensures that tested equipment will not generate harmonic currents at levels that cause unacceptable degradation of the main environment. This directly contributes to meeting compatibility levels established in other EMC standards, which defines compatibility levels for low-frequency conducted disturbances in low-voltage supply systems.

5.2 Block Diagram of Test Setup:

5.3 Test Procedure:

- 1. The EUT was placed on the top of a wooden table 0.8 meters above the ground and operated to produce the maximum harmonic components under normal operating conditions for each successive harmonic component in turn.
- 2. The correspondent test program of test instrument to measure the current harmonics emanated from EUT is chosen. The measure time shall be not less than the time necessary for the EUT to be exercised.

5.4 Test Result

Basic Standard:	BS EN IEC 61000-3-2:2019+A1:2021
Observation time	150s
Windows width:	10 periods - (EN 61000-4-7 Edition 2000)
Temperature:	24 (°C)
Humidity:	55 (%RH)
Atmospheric pressure:	101.1 (kPa)
Operating Mode:	Mode1
Test Result:	Pass
Note:	The EUT is DC supply, so this test item is not applicable, then this EUT could be deemed to comply with the requirements of BS EN IEC 61000-3-2:2019+A1:2021 without test.

6 – VOLTAGE FLUCTUATIONS AND FLICKER TEST

6.1 Application and Limit of Voltage Fluctuations and Flicker Test

Compliance to these standards ensures that tested equipment will not generate flickers and voltage change at levels that cause unacceptable degradation of the main environment. This directly contributes to meeting compatibility levels established in other EMC standards, which defines compatibility levels for low-frequency conducted disturbances in low-voltage supply systems.

Test Item	Limit	Remark	
Pst	1.0	Pst means short-term flicker indicator.	
Plt	0.65	Plt means long-term flicker indicator.	
Tdt (ms)	500	Tdt means maximum time that dt exceeds 3 %.	
dmax (%)	4%	dmax means maximum relative voltage change.	
dc (%)	3.3%	dc means relative steady-state voltage change	

6.2 Block Diagram of Test Setup:

6.3 Test Procedure:

- 1. The EUT was placed on the top of a wooden table 0.8 meters above the ground and operated to produce the most unfavorable sequence of voltage changes under normal operating conditions.
- 2. During the flick measurement, the measure time shall include that part of whole operation cycle in which the EUT produce the most unfavorable sequence of voltage changes. The observation period for short-term flicker indicator is 10 minutes and the observation period for long-term flicker indicator is 2 hours.

6.4 Test Result

Basic Standard:	BS EN 61000-3-3:2013+A2:2021
Short time (Pst)	10 min
Observation time	10 min (1 Flicker measurement)
Temperature:	24 (°C)
Humidity:	55 (%RH)
Atmospheric pressure:	101.1 (kPa)
Operating Mode:	Mode1
Test Result:	Pass

Maximum Flicker results

7- IMMUNITY TEST DESCRIPTION

7.1 General Description

Product Standard		EN 61000-6-1
	EN 61000-4-2	Electrostatic Discharge – ESD: ±8kV air discharge, ±4kV Contact discharge, Performance Criterion B
	EN 61000-4-3	Radio-Frequency Electromagnetic Field Susceptibility Test – RS: 80 ~ 1000 MHz, 3V/m, 80% AM (1kHz), Performance Criterion A
	EN 61000-4-4	Electrical Fast Transient/Burst - EFT, Power line: ±1kV, Signal line: ±0.5kV, Performance Criterion B
Basic Standard	EN 61000-4-5	Surge Immunity Test: 1.2/50 us Open Circuit Voltage, 8 /20 us Short Circuit Current, Power Line: line to line 1 kV, line to ground 2 kV Signal line: line to ground: outdoor: 1kV
Specification, and Performance Criterion required	EN 61000-4-6	Conducted Radio Frequency Disturbances Test – CS: 0.15 ~ 80 MHz, 3Vrms, 80% AM, 1kHz, Performance Criterion A
	EN 61000-4-11	Voltage Dips: 1) 0% residual for 0.5 cycle, Performance Criterion B 2) 0% residual for 1 cycle, Performance Criterion B 3) 70% residual for 25/30 cycles for 50/60Hz, Performance Criterion C Voltage Interruptions: 0% residual for 250/300 cycles for 50/60Hz, Performance Criterion C is required for EUT with battery back-up Performance Criterion C is required for EUT without battery back-up

7.2 The phenomena allowed during and after test in each criterion are clearly stated in the following table

	Performance criteria							
Criteria	During test	After test						
А	Shall operate as intended. May show degradation of performance (see note1). Shall be no loss of function. Shall be no unintentional transmissions.	Shall operate as intended. Shall be no degradation of performance (see note 2). Shall be no loss of function. Shall be no loss of stored data or user programmable functions.						
В	May show loss of function (one or more). May show degradation of performance (see note 1). No unintentional transmissions.	Functions shall be self-recoverable. Shall operate as intended after recovering. Shall be no degradation of performance (see note 2). Shall be no loss of stored data or user programmable functions.						
С	May be loss of function (one or more).	Functions shall be recoverable by the operator. Shall operate as intended after recovering. Shall be no degradation of performance (see note 2).						

NOTE 1:

Degradation of performance during the test is understood as a degradation to a level not below a minimum performance level specified by the manufacturer for the use of the apparatus as intended. In some cases the specified minimum performance level may be replaced by a permissible degradation of performance. If the minimum performance level or the permissible performance degradation is not specified by the manufacturer then either of these may be derived from the product description and documentation (including leaflets and advertising) and what the user may reasonably expect from the apparatus if used as intended.

NOTE 2:

No degradation of performance after the test is understood as no degradation below a minimum performance level specified by the manufacturer for the use of the apparatus as intended. In some cases the specified minimum performance level may be replaced by a permissible degradation of performance. After the test no change of actual operating data or user retrievable data is allowed. If the minimum performance level or the permissible performance degradation is not specified by the manufacturer then either of these may be derived from the product description and documentation (including leaflets and advertising) and what the user may reasonably expect from the apparatus if used as intended.

7.3 Deviations from the standard

No deviations from EN 61000-6-1 were made when performing the tests described in this report.

8- IMMUNITY TEST RESULTS

8.1 Electrostatic Discharge Immunity Test

8.1.1 Test Specification

Basic Standard:	EN 61000-4-2:2009
Test Level:	± 8 kV (Air Discharge)
	± 4 kV (Contact Discharge)
	± 4 kV (Indirect Contact HCP)
	± 4 kV (Indirect Contact VCP)
Temperature:	23.6 (°C)
Humidity:	55 (%RH)
Atmospheric pressure:	101.1 (kPa)
Operating Mode:	Mode1
Operator:	Dong ShengXi

8.1.2 Test Setup

8.1.3 Test Procedure

- 1. Electrostatic discharges were applied only to those points and surfaces of the EUT that are accessible to users during normal operation.
- 2. The test was performed with at least ten single discharges on the pre-selected points in the most sensitive polarity.
- 3. The time interval between two successive single discharges was at least 1 second.
- 4. The ESD generator was held perpendicularly to the surface to which the discharge was applied and the return cable was at least 0.2 meters from the EUT.
- 5. Contact discharges were applied to the non-insulating coating, with the pointed tip of the generator penetrating the coating and contacting the conducting substrate.
- 6. Air discharges were applied with the round discharge tip of the discharge electrode approaching the EUT as fast as possible (without causing mechanical damage) to touch the EUT. After each discharge, the ESD generator was removed from the EUT and re-triggered for a new single discharge. The test was repeated until all discharges were complete.
- 7. At least ten single discharges (in the most sensitive polarity) were applied to the Horizontal Coupling Plane at points on each side of the EUT. The ESD generator was positioned horizontally at a distance of 0.1 meters from the EUT with the discharge electrode touching the HCP.
- 8. At least ten single discharges (in the most sensitive polarity) were applied to the center of one vertical edge of the Vertical Coupling Plane in sufficiently different positions that the four faces of the EUT were completely illuminated. The VCP (dimensions 0.5m x 0.5m) was placed vertically to and 0.1 meters from the EUT.

8.1.4 Performance Criterion Required & Test Result

Table 1: Electrostatic Discharge Immunity (Air Discharge)

Test Level		Test Points	Observation	Criterion	
±2 kV	±4kV	±8kV	Test Points	Performance	Required
		\boxtimes	Gap	В	В
		\boxtimes	Port	В	В
		\boxtimes	Led	В	В
			Other Port	В	В

Table 2: Electrostatic Discharge Immunity (Direct Contact)

	\boxtimes		Back Side	А	В
	\boxtimes		Left Side	А	В
			Right Side	A	В

Test Result: Pass

8.2 Radiated Susceptibility Test

8.2.1 Test Specification

Basic Standard:	EN IEC 61000-4-3:2020
Frequency Range:	80~1000MHz
Modulation:	Amplitude 80%, 1kHz sinewave
Test Level:	3V/m
Temperature:	23.6 (°C)
Humidity:	55 (%RH)
Atmospheric pressure:	101.1 (kPa)
Operating Mode:	Mode1
Operator:	Harris Pan

8.2.2 Test Setup

8.2.3 Test Procedure

- 1. The testing was performed in a fully-anechoic chamber.
- 2. The frequency range is swept from 80 MHz to 1000 MHz, with the signal 80% amplitude modulated with a 1kHz sine wave.
- 3. The dwell time at each frequency shall not be less than the time necessary for the EUT to be exercised and to respond, but shall in no case be less than 0,5s.
- 4. The field strength level was 3V/m.
- 5. The test was performed with the EUT exposed to both vertically and horizontally polarized fields on each of the four sides.

8.2.4 Performance Criterion Required & Test Result

Frequency Band (MHz)	Test Level	Test Points	Observation Performance	Criterion Required
80-1000	3V/m	Front Side	А	А
80-1000	3V/m	Rear Side	А	А
80-1000	3V/m	Left Side	А	А
80-1000	3V/m	Right Side	A	А

Test Result: Pass

8.3 Electrical Fast Transient/Burst Immunity Test

8.3.1Test Specification

Basic Standard :	EN 61000-4-4:2012	
Test Level:	±1 kV for AC Power Line	
	±0.5 kV for Communication Line (If applicable)	
Impulse Frequency:	5kHz	
Impulse Wave-shape:	5/50ns	
Burst Duration:	15ms	
Burst Period:	300ms	
Test Duration:	1 min.	
Temperature:	24 (°C)	
Humidity:	55 (%RH)	
Atmospheric pressure:	101.1 (kPa)	
Operating Mode:	Mode1	

8.3.2 Test Setup

8.3.3 Test Procedure

- 1. Both positive and negative polarity discharges were applied.
- 2. The length of the "hot wire" from the coaxial output of the EFT generator to the terminals on the EUT should be 0.5m.
- 3. The duration time of each test sequential was 1 minute.
- 4. The transient/burst waveform was in accordance with EN 61000-4-4, 5/50ns.

8.3.4 Performance Criterion Required & Test Result

8.4 Surge Immunity Test

8.4.1 Test Specification

Basic Standard :	EN 61000-4-5:2014+A1:2017	
Test Level:	±0.5, 1 kV (Line to Line) for AC Power Line	
	±0.5, 1, 2 kV (Line(s) to Ground) for AC Power Line	
	±0.5 kV for unshielded unsymmetrically operated interconnection lines	
	(If applicable)	
Mayo Shanai	Combination Wave	
wave-Snape.	1.2/50 us Open Circuit Voltage	
	8/20 us Short Circuit Current	
Generator Impedance:	42 ohm between signal line and ground	
	2 ohm between networks	
Phase Angle:	0° /90°/180°/270°	
Pulse Repetition Rate:	1 time / min	
Number of Tests:	5 positive and 5 negative at selected points	
Temperature:	24 (°C)	
Humidity:	55 (%RH)	
Atmospheric pressure:	101.1 (kPa)	
Operating Mode:	Mode1	

8.4.2 Test Setup

8.4.3 Test Procedure

1. For EUT power supply:

The surge is applied to the EUT power supply terminals via the capacitive coupling network. Decoupling networks are required in order to avoid possible adverse effects on equipment not under test that may be powered by the same lines, and to provide sufficient decoupling impedance to the surge wave. The power cord between the EUT and the coupling/decoupling networks was shorter than 2 meters in length.

2. For test applied to unshielded unsymmetrically operated interconnection lines of EUT: (If applicable)

The surge was applied to the lines via the capacitive coupling. The coupling / decoupling networks didn't influence the specified functional conditions of the EUT. The interconnection line between the EUT and the coupling/decoupling networks was shorter than 2 meters in length.

8.4.4 Performance Criterion Required & Test Result

Voltage	Test Points	Observation Performance	Criterion Required
±0.5kV	1	1	1
±1kV	1	А	В
±2kV	1	А	В
±4kV	1	А	В

⊠ Not Applicable

Note: The EUT is DC supply, so this test item is not applicable.

8.5 Conducted Susceptibility Test

8.5.1 Test Specification

Basic Standard:	EN 61000-4-6:2014+AC:2015
Test Level:	3Vr.m.s
Frequency Range:	0.15~80MHz
Modulation:	Amplitude 80%, 1kHz sinewave
Frequency Step:	1 % of preceding frequency value
Temperature:	24 (°C)
Humidity:	55 (%RH)
Atmospheric pressure:	101.1(kPa)
Operating Mode:	Mode1
Operator:	Dong ShengXi

8.5.2 Test Setup

8.5.3 Test Procedure

- The test was performed with the test generator connected to each of the coupling and decoupling devices in turn, while the other non-excited RF input ports of the coupling devices are terminated by a 50-ohm load resistor.
- 2. The frequency range was swept from 150 kHz to 80 MHz, using the signal level established during the setting process and with a disturbance signal of 80 % amplitude. The signal was modulated with a 1 kHz sine wave, pausing to adjust the RF signal level or the switch coupling devices as necessary. The sweep rate was 1.5 x 10-3 decades/s. Where the frequency range is swept incrementally, the step size was 1 % of preceding frequency value from 150 kHz to 80 MHz.

- 3. The dwell time at each frequency was less than the time necessary for the EUT to be exercised, and able to respond. Sensitive frequencies such as clock frequency(ies) and harmonics or frequencies of dominant interest, was analyzed separately.
- 4. Attempts was made to fully exercise the EUT during testing, and to fully interrogate all exercise modes selected for susceptibility.

8.5.4 Performance Criterion Required & Test Result

Frequency Band (MHz)	Voltage (Vrms)	Test Points	Observation Performance	Criterion Required
0.15-80	3	/	А	А

Test Result: Pass

Passed	\boxtimes	Not Applicable

8.6 Voltage Dips, Short Interruptions Immunity Tests

8.6.1 Test Specification

Basic Standard:	EN IEC 61000-4-11:2020/AC:2022
Test Level:	Voltage Dips:
	1) 0% residual voltage for 0.5 cycle,
	2) 0% residual voltage for 1 cycle,
	3) 70% residual voltage for 25/30 cycles,
	Voltage Interruptions:
	0% residual voltage for 250/300 cycles
Interval between event:	10 seconds
Phase Angle:	0°/180°
Test cycle:	3 times
Temperature:	24 (°C)
Humidity:	55 (%RH)
Atmospheric pressure:	101 (kPa)
Operating Mode:	Mode1

8.6.2 Test Setup

8.6.3 Test Procedure

The EUT was tested for each selected combination of test levels and duration with a sequence of 3 dips/interruptions with intervals of 10s (between each test event). Each representative mode of operation shall be tested. Abrupt changes in supply voltage shall occur at zero crossings of the voltage waveform.

8.6.4 Performance Criterion Required & Test Result

Ut: 230V AC, 50Hz
