ISIP gateway
The ISDN to SIP Converter

Product Overview

Table of Contents

1.0 INTRODUCTION

$ISIP_8$ - The ISDN to SIP Convertor for Basic Rate ISDN (BRI)

The Basic Rate ISDN to SIP Convertor ($ISIP_8$) is delivered with 4 x BRI Ports, and a single Network Port that can support up to 8 x SIP Trunk channels (2 per BRI).

$ISIP_{30}$ - The ISDN to SIP Convertor for Primary Rate ISDN (PRI)

The Primary Rate ISDN to SIP Convertor ($ISIP_{30}$) is delivered with 1 x PRI Port supporting 1 x Primary Rate ISDN connection and 1 x Network Port that can support up to 30 x SIP Trunk channels.

NOTE: The *ISIP* gateway requires a Class 1, POE (Power Over Ethernet) supply.

ISIP Management Portal.

The *ISIP* Management Portal is a Cloud based Manager for provisioning, monitoring and servicing your estate of *ISIP* gateways. The example below for the "reseller GB limited shows they have an estate of 4 devices, 2 of which have been implemented through their "sub-reseller" One Resale Ltd. This same page shows the in-service details of GB Ltd's direct customer systems (Tower Electrics and Blackpool Council).

The screenshots on the following page show the headline information about the estate, including service status and number of operational channels. They also show serviceability information including, if software upgrades or system reboots are scheduled for any reason.

Comprehensive details are supplied in the Installation manual (link in Support tab).

2.0 OPERATION

The *ISIP* gateway is normally shipped directly to your customer. The Box contains the gateway and any necessary cross over cable(s) required to connect it to the flying ISDN lead from the existing PBX. POE is required (normally from a LAN switch) to power the *ISIP* gateway.

Upon connection to the Customer's network and powered up, the *ISIP* gateway will connect to the *ISIP* Management Portal to receive its specific configuration, which would have been set up in advance.

ISIP Management Portal

Initial Setup.

Once your first order for an *ISIP* gateway is accepted, your account would be set up on the Management Portal. Using the information you provide with the order, the appropriate licences for the ordered *ISIP* gateway would be entered on the Portal against your customer reference and your account. These licences are unique to the particular *ISIP* gateway that is dispatched against your order.

Account Personalisation

You will be provided with default account names and login details for your account, which you would customise in accordance with your company security policy.

Customer Setup

Clicking on the respective customer *ISIP* gateway (e.g Tower Electrics), you will configure the normally required SIP and ISDN parameters necessary for the customer's unique requirements using the configuration table.

Going Live

When the Customer's *ISIP* gateway contacts the Management Portal, initial checks are performed automatically to confirm that the correct licences containing the appropriate number of SIP channels are being supplied to the correct gateway. The setup configuration you have entered is automatically downloaded to the gateway. A reboot of the gateway is necessary for this configuration to become operational. This can be initiated in accordance with your configuration preferences (immediately, scheduled or when idle etc).
Ongoing Serviceability

Each *ISIP* gateway "polls" the Management Portal periodically to provide a status update and to download any configuration or operational changes you have determined necessary. These changes can be made on demand or scheduled for a later time at your determination. The Status updates enable you to easily see the status of your entire state of *ISIP* gateways and proactively investigate any potential service issues.
