06DA,DE,DH 06EV,EW Compressor Units

3 to 40 Nominal Tons

06D,06E Compressors

06E COMPRESSOR UNIT

A quality compressor for the right application

The Carlyle line of 06D, 06E semi-hermetic compressors is designed for light, medium, or heavy duty applications from 3 through 40 tons. Use them with complete confidence for air conditioning or refrigeration, with either water-cooled, air-cooled, or evaporative condensers.

Features/Benefits

System dependability

Reliable trouble-free operation and long unit life is assured with this motor-compressor. The hermetically sealed unit eliminates dirt, air, and moisture contamination in the refrigeration system, and also eliminates shaft seal and alignment problems. Compressor wear is minimized by the positive pressure lubrication provided with a built-in oil pressure regulator and an automatically reversible oil pump.

Operating efficiency

Power conserving capacity control valves on Carlyle compressors provide the most efficient operation at the lowest cost. These valves automatically match the compressor capacity to system load variations.

Suction cutoff unloading further reduces energy usage during unloaded operation. Valve body shuts off passage from suction manifold, preventing charge from unnecessarily being pulled into cylinder. This results in an EER (Energy Efficiency Ratio) improvement of as much as 39.5% at 33% load.

Rely with confidence on the overall protection devices built into these fine compressors. The Time Guard® circuit prevents rapid compressor cycling. High- and low-pressure switches protect against excessive motor loads due to refrigeration system problems.

A lightweight crankcase, made of fine grain cast iron, meets all code pressure requirements. Large refrigerant gas passages guarantee low pressure losses and higher compression efficiency as well as providing for motor cooling.

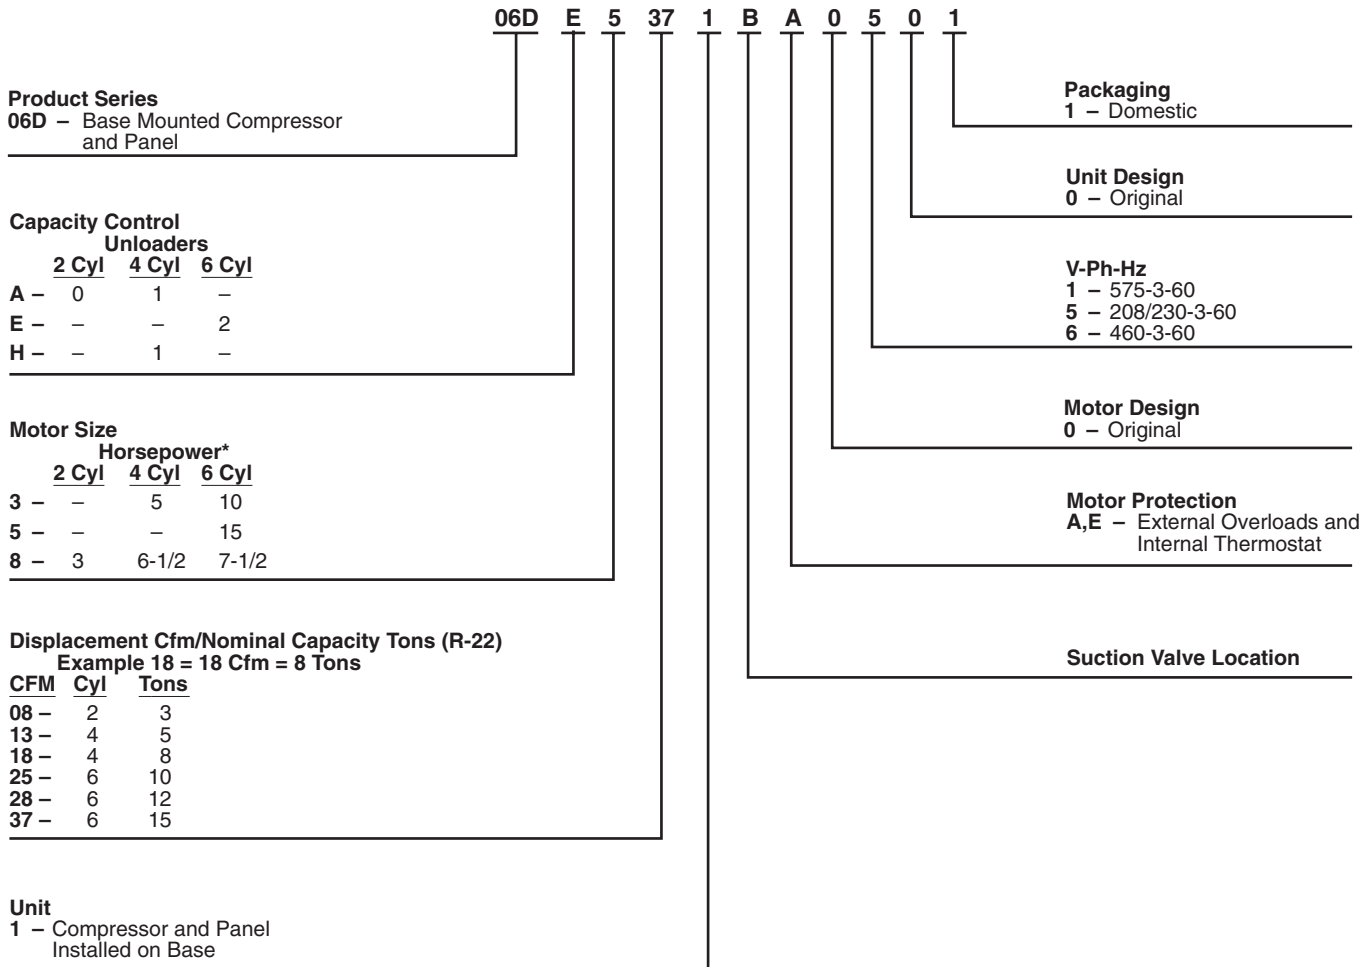

Sound level is kept at a minimum with a discharge line muffler. This muffler is an accessory for the 06D and 06E compressors.

*Compressors listed are for R-22 applications. For R-134A an 06EM compressor is standard offering; an 06ER compressor is standard for R-507/404A. Factory compressor substitutes may be made. Contact Carrier Sales Representative.

Base unit dimensions

06D COMPRESSOR UNIT

NOTES:

1. For standard service practices, such as troubleshooting and refrigerant charging, allow a minimum 2'-6" clearance around the unit.
2. For compressor removal, allow a minimum 3' wide access aisle to and from the unit.
3. Local codes or jurisdiction may prevail for unit clearances.

06E COMPRESSOR UNIT

NOTES:

1. For standard service practices, such as troubleshooting and refrigerant charging, allow a minimum 2'-6" clearance around the unit.
2. Recommended service space for condenser tube removal is one condenser length at either end.
3. For compressor removal, allow a minimum 3' wide access aisle to and from the unit.

Selection procedure

I Determine refrigerant, load, saturated suction temperature, and saturated discharge temperature.

Given:

- Refrigerant R-22
- Cooling Load 40 Tons
- Saturated Suction Temperature 40 F
- Saturated Discharge Temperature 105 F

selection, power input (kW) requirements, and total heat rejection (THR). (Use direct interpolation where job requirements fall between values shown. Do not extrapolate.)

Select an 06EW044 which has a cooling capacity of 42.7 tons at a saturated suction temperature of 40 F and saturated discharge temperature of 105 F. Motor-compressor power input is 37.3 kW and total heat rejection is 53.3 tons.

Refer to Compressor Capacities notes for information concerning basis for compressor ratings and capacity corrections due to refrigerant superheat or subcooling.

II Enter Compressor Capacities table for correct refrigerant at required suction and discharge temperatures. Read across until a suitable capacity is found. Determine motor-compressor

LEGEND

- Cap.** — Capacity (tons)
- kW** — Power Input
- SDT** — Saturated Discharge Temperature (F)
- SST** — Saturated Suction Temperature (F)
- THR** — Total Heat Rejection (tons)

*Refer to compressor capacity notes, page 14.

NOTE: To ensure proper motor cooling, it is required that all 6-cylinder compressors operating with R-22 at 20 F SST or below have one of the 2 unloaders disconnected. Cylinder head fan required at SST of 0° F and below for R-22 for all compressors.

COMPRESSOR CAPACITY NOTES

- Compressor capacities are based on 1750 rpm and 15 F subcooling.
- Liquid subcooling, greater than (less than) the 15 F incorporated in the ratings, increases (decreases) system capacity by 1/2 of 1% for each degree of subcooling for R-22 and increases (decreases) system capacity by 6/10 of 1% for R-134A and R-507/404A. When correcting for subcooling, power input does not change. Adjusted total heat rejection (tons) equals adjusted capacity + .285 x kW input.
- Refrigerant temperatures shown are saturation temperatures corresponding to pressure indicated at compressor. Actual gas temperatures are higher because of superheat.
- Capacities are based on actual suction gas temperatures to the compressor of 65 F for R-134A and R-507/404A. (This assumes superheat is obtained from liquid-suction interchanger or in evaporator.)
Capacity corrections, for other than rated suction gas temperatures, may be obtained from Rating Basis and Capacity Multipliers table. R-22 ratings can be used without adjustment.

*Compressor cylinders unload in response to a self-contained suction-pressure controlled unloader valve(s) for 06D and 06E compressors. When suction pressure drops below unloader set point, cylinders unload. When suction pressure rises above cylinder load set point pressure, cylinders return to operation. Capacity control unloader set points and differential (load point – unload point) are adjustable.

LRA — Locked Rotor Amps
MCC — Maximum Continuous Current
RLA — Rated Load Amps

*Refer to physical data table to match compressor motor with correct compressor unit.

NOTES:

1. RLA (rated load amps) value shown is: $MCC \div 1.40 = RLA$.
2. For minimum contactor sizing, use RLA value determined by: $MCC \div 1.40 = RLA$.

3. For wiring sizing, the RLA value can be determined by: $MCC \div 1.56 = RLA$.
4. Compressor operating amps at any specific conditions can only be determined from a performance curve.
5. RLA values for 06D compressor protected by a calibrated circuit breaker will depend on must-trip value of circuit breaker.
6. Ohm values shown for resistance are approximate and shown for reference only. Motors from different vendors and motors of different efficiencies can differ up to 15% from data shown.
7. Electrical data for motor part numbers 06DR and 50 Hz units (not shown) are available from Carrier Sales Representative.

NOTES:

1. Factory wiring is in compliance with NEC. Any field modifications or additions must be in compliance with all applicable codes. Use copper, copper-clad aluminum for field power supply only.
2. Field power supply wiring must be 75 C minimum.
3. Compressor thermally protected. Three-phase motors are protected against primary single-phasing condition.
4. Pilot duty control must be field supplied. Minimum contact rating must be 25 va.
5. 60 Hz units have 120 volt control circuit. 50 Hz units have 230 volt control circuit. A separate source of supply at the correct voltage must be field supplied through a fused disconnect device with a

maximum rating of 15 A to TB2 connections L1 (Hot Side) and

L2 (Neutral).

6. Open control circuit disconnect switch for servicing only. Disconnect must remain closed for crankcase heater to operate.
7. A transformer of the following rating may be field supplied for 60 Hz units: 350 va.
8. Transformer must be fused and grounded per applicable codes.
9. If any of the original wiring furnished must be replaced, it must be replaced with 90 C wire or its equivalent.

Typical piping and wiring

Application data

Adequate lubrication depends on proper oil return to compressor (especially during unloaded operation) and keeping liquid refrigerant out of crankcase (refrigerant dilutes oil).

Correct system piping design prevents gravity flow of refrigerant to compressor while permitting oil return. Refer to Carrier System Design Manual for correct refrigerant piping techniques.

Crankcase heater energized and Liquid Line Solenoid closed during shutdown periods restrict refrigerant migration to compressor and absorption of refrigerant by the oil (minimum protection). A discharge line check valve prevents refrigerant migration from condenser to compressor and should be installed on air-cooled applications where condenser or receiver ambient temperature is at or above compressor ambient temperature.

Single pumpout control incorporates a liquid line solenoid valve and prevents refrigerant migration by allowing unit to shut off only after all refrigerant has been removed from evaporator. (Compressor shuts off on low-pressure cutout.)

Automatic pumpdown control allows compressor to cycle on for short intervals during normally "off" periods. This periodically removes any refrigerant from evaporator which may have accumulated.

This control should not be used with 06D or 06E compressors having cylinder head unloaders.

Direct-expansion cooler applications (excluding brine) should not incorporate single pumpout or automatic pump-down control. Crankcase heater and liquid line solenoid (minimum protection) are recommended for these applications.

Compressors located in a space subject to low-ambient temperatures require special provision for proper operation during start-up. (Low-ambient temperatures cause compressor to operate at abnormally low suction pressures during start-up.)

Proper operation can be maintained by:

1. Heating the space,
2. A time-delay relay installed to bypass the low-pressure control during start-up, or
3. Use of a suction temperature control to operate compressor, instead of low-pressure control.

Guide specifications

06D and 06E Semi-Hermetic Reciprocating Compressor Unit

HVAC Guide Specifications

Size Range: **3 to 15 tons**

Carrier Part Number: **06D**

Size Range: **20 to 40 tons**

Carrier Part Number: **06E**

Part 1 — General

1.01 SYSTEM DESCRIPTION

Reciprocating type, semi-hermetic refrigerant compressor for use with refrigerants R-22, R134a, or R-507/404A.

1.02 QUALITY ASSURANCE

- A. Unit performance shall be rated according to ARI 520 latest edition and comply with ANSI/ASHRAE 15 safety code, NEC, and ASME Code.
- B. Compressors will be factory run tested to ensure proper performance.

1.03 DELIVERY, STORAGE AND HANDLING

Unit will be stored and handled according to manufacturer's instructions.

Part 2 — Products

2.01 EQUIPMENT

A. General:

Factory assembled single piece, refrigerant compressor unit. Contained within the package shall be a semi-hermetic reciprocating compressor, structural steel base, control panel, power terminal box, wiring, piping, and controls required prior to field start-up.

B. Compressors:

Reciprocating semi-hermetic type only, with shutoff valves, automatically reversible positive displacement oil pump, oil charge, crankcase heater with relay, and suction pressure actuated cylinder unloaders. Unit mounted on vibration isolators.

C. Controls and Safeties:

- 1. Included in the control panel are power and control terminal blocks, contactors, control relays, on/off switch, and unit designed to start with controlled cylinders unloaded. Factory assembled control box to be tested and mounted on structural base.
- 2. Safeties in the control box include high- and low-pressure switches, timer to prevent compressor short cycling, overload relays or circuit breakers, and control circuit fuse.

D. Electrical Requirements:

All control and power wiring between control box and compressor shall be factory assembled.

E. Special Features:

Certain standard features are removed and replaced by those features designated by * below. Consult your local Carrier sales office for amending specifications.

* 1. Electric Actuated Unloaders:

Includes all necessary hardware to allow field conversion from suction pressure actuated to electric solenoid actuated unloaders.

* 2. Water-Cooled Condenser:

Multipass shell and tube with integral finned copper tubes for field installation. Shall be factory tested to comply with ASME Code for unfired pressure vessels, ARI Standard 450 for condensers, and ANSI/ASHRAE safety code. Equipped with pressure relief, liquid line shutoff, and connection for water regulating valve.

* 3. Discharge Muffler:

Field installed discharge line muffler for noise reduction.

Manufacturer reserves the right to discontinue, or change at any time, specifications or designs without notice and without incurring obligations.
