| 4 | | | |
| 5 | | | |

| TOOLS REQUIRED | |
|------------------------|--|
| Chainlink Release Tool | |

| NOTES | |
|---|--|
| Ensure the correct quick link is used to reconnect the chain. | |

INSTALLATION

WattShop Cratus chains are installed just as you would a normal chain. Chains come supplied with a split link however 10 speed Shimano chains may be supplied with a press pin.

When using a split link ensure that the pins are clear of wax once inserted through the chain. Any excess powder that falls off the chain can be wiped off. The chain requires 45-60 minutes of running in before it will loosen up and be working at it's optimum. This can be done on the road, rollers or a turbo trainer.

MAINTENANCE

WattShop Cratus chains are very easy to maintain. They wipe clean with a cloth and don't require any lubrication for the first 300-400km.

After this the performance will start to decrease and the chain will require a re-wax to maintain peak performance. If your chain gathers dirt and grime, you can lightly wash it with warm soapy water. Do not use chemicals or solvents.

RE-WAXING

After 300-400km the chain's performance will gradually decrease to around the same level as a normally lubricated chain.

To restore its performance back to the highest level a re-wax is required. WattShop offer this service. Please contact us by email info@shopforwatts.co.uk or through our website to order a re-wax. Alternatively we offer a home waxing kit that can be used to re-wax your chain.
