

AnteAGE® Microchanneling Solution – Clarifying

Box of 5 (2 ml) ball-roller vial

ALL SKIN TYPES, ALL AGES

The AnteAGE Microchanneling Solution for ACNE skin contains pro-healing, anti-inflammatory growth factors and cytokines derived from laboratory culture of human bone marrow mesenchymal stem cells, the specialized cells that science has determined function as “command and control” of healing in all injured tissues. Hyaluronic Acid provides lubrication and is a powerful humectant that promotes rapid re-hydration and volume enhancement within the upper layers of the skin. Additional recombinant growth factors, peptides and cytokines that target the mechanisms behind acneic skin are added for enhanced performance and results. These products contain no cells or cell remnants. They are removed during ultrafiltration, the final step in the laboratory culture process.

Application & Usage:

Follow instruction on the AnteAGE PRO Stem Facial protocol. May also be used with Microneedling, Rezenerate and other advanced modalities.

AnteAGE® Microchanneling Solution – Clarifying

Wholesale

Box of 5 (2 ml) ball-roller vial

\$75.00

Key Selling Points:

- Paraben-Free, Sulfate-Free, Phthalate-Free, FD&C Dye, Cruelty and Cell Free
- Contains pristine Bone Marrow Mesenchymal Stem Cell derived cytokines. A superior cell source for culture compared to Fibroblast cells and Adipose Stem Cells. Maintains a stronger anti-inflammatory portfolio of cytokines.
- Formulated with a Hyaluronic Acid base, and no toxic ingredients seen in other Mesotherapy and Microneedling solutions.
- Additional recombinant growth factors and cytokines, specific to treating aging skin, are added for a better aesthetic outcome.
- Can be used post-procedure to initiate a faster healing response.

Key Ingredients & Function:

Bone Marrow Stem Cell Conditioned Media

Physiologically balanced bio-signals released upon culture of Bone Marrow Stem Cells. Acting as the “command and control” over the processes of healing and inflammation. Highly superior to all other cell types available to culture for rejuvenation and regeneration.

Recombinant IL-10

Interleukin-10 is an anti-inflammatory cytokine that is responsible for controlling the over expression of pro-inflammatory cytokines seen in abundance within acneic skin.

Recombinant BD3

Beta Defensin 3 is a skin antimicrobial peptide that shows broad range of activity against invading pathogens, helping to support healthy skin ecology and defense systems.

Hyaluronic Acid

Excellent gliding agent; humectant; native to the skin; supports ECM.

Ingredients:

Deionized Water, Stem Cytokines and Growth Factors (derived from laboratory culture of bone marrow mesenchymal stem cells), Hyaluronic Acid, Interleukin-10 (IL-10), Beta Defensin 3 (BD3), Dehydroacetic Acid & Benzyl Alcohol as preservatives
