

ND THROTTLE

LENS ADAPTERS + VARIABLE ND

IMAGE CONTROL FROM A LENS ADAPTER

When Fotodiox created the Vizelex ND Throttle, it came from the simple idea to create a family of lens adapters that do more than simply couple a lens to a camera body. We wanted to do more than simply control the lens' manual aperture. We wanted vintage and modern lenses to be more versatile for filmmakers. So we created the ND Throttle.

Every adapter in the ND Throttle line has a built in variable ND filter that goes from ND2-ND1000 (with some specialized models going between ND2-ND7). Create shallow depth of field effects, even with the lens' aperture wide open. Adjust the ND on the fly throughout changing lighting conditions on location. Or create dramatic long exposure blur effects during dramatic timelapses - even under a full sun. Also, the ND Throttle's variable ND works with wide angle lenses that are notoriously impossible to use with a traditional front-mounted variable ND.

The ND Throttle has become an essential addition to every videographer and filmmaker's camera bag. Quickly change between lenses, while maintaining full creative control over the image with full-time variable ND. Additionally our new "Smart" line of ND Throttles enable lens and camera to communicate. You get access to electronic aperture, image stabilization, and even auto focus on supported lenses.

There are over 30 different lens/camera combinations of ND Throttle. The ND Throttle brings a new dimension of image control to practically any lens in your collection, and it's all easier than ever.
