Siemens SQM5 control motors provide unequalled accuracy and resolution

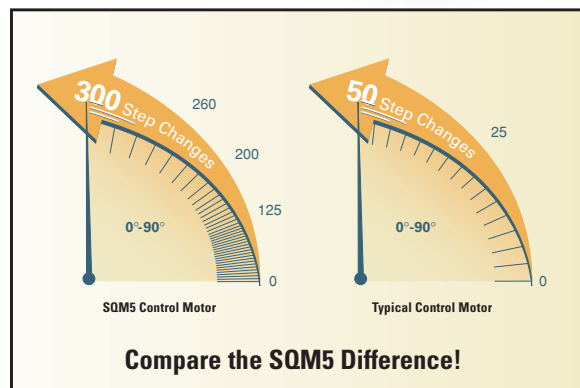

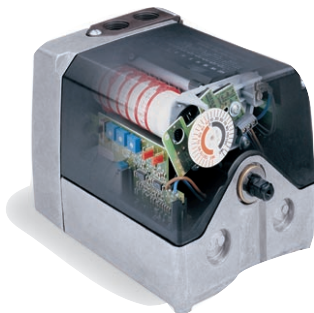

The ultra accurate SQM5 control motor responds with 300 step changes to the finite adjustments provided by advanced process control systems.

The result?

Dramatically improved process performance and product quality.

Obtaining better control

The SQM5 features a selectable linearization function that electronically converts the input signal to match a typical butterfly valve's flow characteristics. Consequently, flow changes are directly proportional to the input signal throughout the modulating range.

Contact Siemens to improve process performance and receive JUSTICE!
