

CL38 Regulator

Commercial & Industrial Regulator

The CL38 is a constant pressure loaded regulator for use where a closer pounds to pounds regulation is desired than can be obtained from conventional spring loaded regulators. Since, it requires an inlet pressure supply of only ½ PSIG above outlet pressure, this unit can be used where demand type loading will not meet the low pressure differential. The key feature of the CL38, compared to other CL series regulators, is the large 2" valve body which is designed to handle the increased gas flows of the larger orifice sizes.

APPLICATIONS

Appropriate for commercial and industrial applications where very accurate pressure control is required such as "fixed-factor" metering applications or large boiler and furnace applications.

OPTION DESIGNATIONS*

- » CL38 Internal registration (no control line required)
- » CL38M Equipped with closed-throat and control line tap for remote downstream control (External registration)
- » CL38IM Equipped with an Internal Monitor orifice; Internal Registration (no control line required)
- » CL38IMV Equipped with an Internal Monitor Orifice plus Vent hole option for Monitor warning indication; Internal Registration (no control line required)

*All versions are available with either

- -1 or -2 pilot:
- » #1 pilot for 5" w.c. to 5 PSIG outlet pressure (Model Name Example: CL38-1)
- » #2 pilot for 1 PSIG to 30 PSIG outlet pressure (Model Name Example: CL38-2)

BENEFITS

- » Economical
- » Light weight
- » Accurate pressure control for "fixedfactor" measurement applications
- » No special start-up procedures required
- » Internal Monitor version eliminates the need for external relief valves or separate monitoring devices
- » No special tools required for outlet pressure adjustment
- » No minimum differential pressure requirement

FEATURES

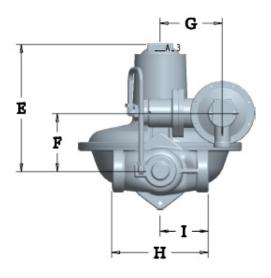

- » Constant loaded pilot design ("fixed-factor" pressure control)
- » Interchangeable brass orifice
- » Internal lower diaphragm chamber pressure flow control
- » 133 in2 of diaphragm area
- » Spring-loaded pilot internal relief valve assembly
- » Field interchangeable pilot adjustment spring
- » Controlled internal bleed hole eliminates pulsation
- » Wide range of valve body sizes including NPT and Flange connections
- » 16 different available assembly positions
- » Capacities from 1500 CFH to 20,000 CFH available

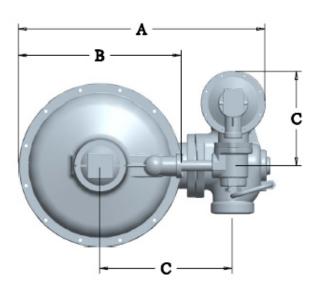

SHIPPING WEIGHT

One regulator per box Box weight: 33 lbs.

| Flanged Valve Body | 2 3* | 2 3* | | | |

^{*}With 2-inch bore.

CORRECTION FACTORS FOR NON-NATURAL GAS APPLICATIONS

The may be used to control gases other than natural gas. To determine the capacity for gases other than natural gas, multiply the values within the capacity tables by a correction factor. The table below lists the correction factors for some of the more common gases.

| Gas Type | Specific Gravity | Correction Factor (CF) |
|--------------------------|------------------|---------------------------|
| Air | 1.00 | 0.77 |
| Butane | 2.01 | 0.55 |
| Carbon Dioxide (Dry) | 1.52 | 0.63 |
| Carbon Monoxide (Dry) | 0.97 | 0.79 |
| Natural Gas | 0.60 | 1.00 |
| Nitrogen | 0.97 | 0.79 |
| Propane | 1.53 | 0.63 |
| Propane-Air-Mix | 1.20 | 0.71 |

To calculate the correction factor for gases not listed in the table above, use the gases' specific gravity and insert it in the formula listed below:

Correction Factor (CF) =

Where:

 SG_1 = Specific gravity of the gas in which the capacity is published.

 SG_2 = Specific gravity of the gas to be controlled.

Wide Open Flow Calculations

For wide-open orifice flow calculations use the following equations:

use: $Q = K\sqrt{P_2(P_1 - P_2)}$ For $\frac{P_1}{P_2} > 1.89$ use: $Q = \frac{KP_1}{2}$ For

 P_1 = Absolute Inlet Pressure (PSIA) P₂ = Absolute Outlet Pressure (PSIA) Where:

> Q = Flow Rate (SCFH) K = Orifice Coefficient (SCFH/PSI)

Notes:

K valves are wide open for each orifice size.

Loading ring set at 0° for PSIG outlet pressures. Loading ring set at 25° for inches w.c. outlet pressures. Exact settings may vary with individual applications of pressures and load conditions.

Set point at each outlet pressure was reached using 200 SCFH of flow.

Figures below heavy line may show differentials above allowable limits. Check closing spring tables to be sure.

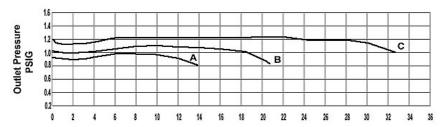

Do not operate orifice in shaded inlet pressure area.

CL38 PERFORMANCE CURVES

| Type and model | CL38 |
|----------------|------------|
| Inlet size | 2-inch NPT |
| Outlet size | 2-inch NPT |
| Orifice size | 1" |

All test results are reported at a base of 14.7 PSIG at 60°F and with 0.6 S.G. gas. Loading ring @ 0 degrees.

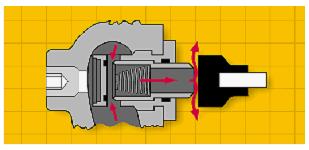

A. 10 PSIG - W.O.R. 14100 SCFH

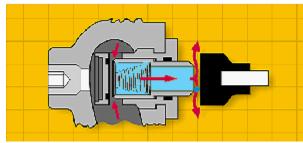

B. 20 PSIG - Set. 20800 SCFH

C. 40 PSIG - W.O.R. 32800 SCFH

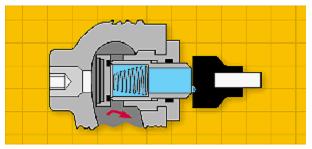

INTERNAL MONITOR PRINCIPLE OF OPERATION

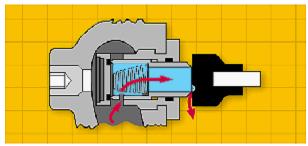

A. Standard regulator and upstream monitor orifice.

B. Standard regulator orifice failed; upstream monitor orifice

C. Main orifice failed; upstream monitor orifice lock-up.

D. V option; vents a small volume of gas to atmosphere through relief valve.

Inlet pressure

Outlet pressure

PRINCIPLE OF OPERATION

A. Normal operation. The internal monitor (IM) orifice performs like a standard regulator and monitor orifice, in that the monitor orifice is wide open under normal operation and the regulating orifice and valve seat position themselves to control outlet flow and pressure. The regulator is free to lock-up in the usual manner, with pressure increase to position the valve seat gas tight against the regulating orifice face. Both the monitor seat and the regulator seat may close together if the positive shock lock-up exceeds the monitor spring setting.

B. Monitor operation. If the regulator valve seat fails to control the gas flow and pressure due to foreign matter between the seat and orifice face, or if the seat is eroded, the internal monitor orifice automatically goes into operating position. Any time the pressure on the large main diaphragm exceeds the power of the fixed monitor spring and the adjusted pressure of the main spring, this increase in outlet pressure causes the valve seat to push against the sliding orifice, compressing the monitor spring and positioning the monitor orifice to control the gas flow and override outlet pressure.

The IM orifice now functions as a monitor regulator and will continue to monitor so long as the main seat fails to control at the normal adjusted outlet pressure. If the gas load demand is increased beyond the internal monitor's capacity, the outlet pressure is reduced to normal adjusted pressure and the regulator resumes normal operation.

- C. Monitor lock-up. If the demand for gas is decreased to zero flow during monitor operation, the sliding orifice continues to close until its orifice is in the gas tight position (monitor lock-up) against the Buna-N monitor valve seat. (See the Internal Monitor Lock-up Pressure table for the outlet pressure required for internal monitor lock-up.)
- D. Vent hole V option. On installations where a small volume of over-pressure gas can be safely vented to the atmosphere, the advantages of both the pilot relief valve and monitor safety can be combined. If the flow is decreased to zero or just greater than zero, the vent hole in the internal monitor orifice allows gas to slowly bleed downstream and cause the pressure to rise to the relief point of the pilot's internal relief valve. The gas then bleeds to the atmosphere indicating a problem with the regulator is reduced to normal adjusted pressure and the regulator resumes normal regulation.

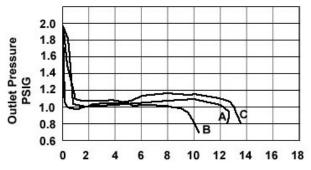

INTERNAL MONITOR LOCK-UP PRESSURE

CL38 IM PERFORMANCE CURVES

| Type and model | CL38 IM |
|----------------|------------|
| Inlet size | 2-inch NPT |
| Outlet size | 2-inch NPT |
| Orifice size | 3/4" |

All test results are reported at a base of 14.7 PSIG at 60°F and with 0.6 S.G. gas.

- A. Normal regulation
- B. Failed with foreign particle
- C. Failed with eroded valve seat

Loading ring @ 0 degrees

VENT LINES FOR REGULATORS

If you are constructing vent lines to be attached to regulators installed indoors, follow a few basic rules:

- a. Never use pipe sizes smaller than the vent size; smaller pipe sizes restrict the gas flow. If a long gas run must be used, Itron advises increasing the pipe one nominal size every ten feet to keep the flow restriction as low as possible.
- Keep the vent line length as short as possible to minimize the restriction and reduce the vent's tendency to cause regulator pulsation.
- Support the vent pipe to eliminate strain on the regulator diaphragm case.
- Always point outdoor vent pipes in the downward position to reduce the possibility of rain, snow, sleet, and other moisture entering the pipe. Install a bug screen in the end of the pipe.
- Do not locate the vent line terminus near windows, fans, or other ventilation equipment. See the installation instructions furnished with the regulator.
- Adhere to all applicable codes and regulations.
- If your vent pipe causes regulator pulsation, consult your sales representative or manufacturer.
- Itron strongly recommends running a separate vent line for each regulator. Headers with various installed devices can cause regulator malfunction.

Caution Ensure the end of the vent line is away from ANY potential ignition sources. It is the installer's responsibility to verify the vent line is exhausting to a safe environment.

INSTALLATION

Warning Itron does not endorse or warrant the completeness or accuracy of any third party regulator installation procedures or practices, unless otherwise provided in writing by Itron. Follow your company's standard operating procedures regarding the use of personal protection equipment (PPE). Adhere to guidelines issued by your company in addition to those given in this document when regulators are installed.

- a. Remove all shipping plugs from the regulator inlet, outlet, and vent before installation.
- b. Verify the piping interior and regulator inlet and outlet are clean and free of dirt, pipe dope, and other debris. Dirt and other foreign materials entering the regulator can cause a loss of pressure control.
- c. Apply pipe joint sealant to the male pipe threads. Do not use pipe joint material on the regulator's female threads. Joint sealant could become lodged in the regulator and cause a loss of pressure control.
- d. Gas must flow through the regulator's valve body in the direction cast on the regulator body. Gas flowing in the wrong direction can overpressure and cause damage to the regulator.
- e. The pilot diaphragm casing can be mounted in any position relative to the body through a full 360° angle at 90° increments.
- When the regulator is installed OUTDOORS, the vent must always be positioned so that rain, snow, moisture or foreign particles cannot enter the vent opening. Itron recommends positioning the pilot vent downward to avoid entry of water or other matter which could interfere with the proper operation of the regulator. The vent should be located away from building eaves, window openings, building air intakes and above the expected snow level at the site. The vent opening should be inspected periodically to insure it does not become blocked by foreign material as outlined in DOT PHMSA-RSPA-2004-19856.
- When the regulator is installed INDOORS, the vent must be piped to the outside atmosphere using the shortest length of pipe, the fewest possible pipe elbows, and a pipe diameter as large as the vent size or larger. USING VENT PIPE SMALLER THAN THE VENT CONNECTION LIMITS THE REGULATOR'S INTERNAL RELIEF VALVE CAPACITY. The outlet end of the pipe must be protected from moisture and the entrance of foreign particles. The regulator should be specified by the user with the size vent and pipe threads desired to make the vent pipe connection.

START-UP PROCEDURE

- a. Mount a pressure gauge downstream of the regulator to monitor the downstream pressure.
- b. With the downstream pressure valve closed, slowly open the inlet valve. The outlet pressure should rise to slightly more than the setpoint. Verify there are no leaks and all connections are tight.
- c. The regulator was pre-set at the factory to match order specifications. If necessary, adjust the outlet pressure by removing the seal cap on the top of the pilot spring housing and adjusting the ferrule or screw inside the pilot spring housing using a large flat-head screwdriver. Do not remove the seal cap from the main regulator unless all gas is shut off and all pressure is released from the regulator. Failure to shut off gas and release pressure from the regulator will allow pressurized gas to escape from the regulator. With a small amount of gas flowing through the regulator, rotate the pilot ferrule clockwise to raise the outlet pressure or counter-clockwise to lower the outlet pressure.
- d. Replace the seal cap and check for leaks after the desired outlet pressure is achieved.

The regulator is ready for operation.

Notes:

- a. The maximum inlet pressure for this regulator is dependent upon the size of the orifice and model designation. The non-relief models are limited to 60 pounds per square inch gauge maximum inlet pressure unless additional safeguards are used as outlined in the DOT code, OPS, Part 192, section 192,197.
- b. This regulator should not be used for temperatures exceeding 150° F.
- When these models are used on liquid petroleum gases, they should be restricted to secondary control purposes and can only be used for second stage pressure reduction in the gaseous phase.
- Contact Itron, Owenton, KY with customer inquiries about the selection, application, and recommended instructions for gas service regulators.

SAFETY WARNING

This product, as of the date of manufacture, is designed and tested to conform to all governmental and industry safety standards as they may apply to the manufacturer. The purchaser/user of this product must comply with all fire control, building codes, and other safety regulations governing the application, installation, operation, and general use of this regulator to avoid leaking gas hazards resulting from improper installation, startup or use of this product.

Itron strongly recommends installation by a qualified professional and periodic inspection of pressure regulators (inspections may be required by local applicable codes or regulations).

Inspections should include checking for gas quality, cycle numbers, external environmental changes, and operating conditions that impact wear on the regulator's moving parts. To ensure safe and efficient operation of this product, replace worn or damaged parts found during inspection.

LIMITED WARRANTY

Itron, Inc. 970 Highway 127 North, Owenton, Kentucky 40359-9302, warrants this gas product against defects in materials and workmanship for the earlier of one (1) year from the date the product is shipped by Itron or a period of one year from the date the product is installed by Itron at the original purchaser's site. During such one-year period, provided that the original purchaser continues to own the product, Itron will, at its sole option, repair any defects, replace the product or repay the purchase price.

» This warranty will be void if the purchaser fails to observe the procedures for installation, operation or service of the product as set forth in the Operating Manual and Specifications for the product or if the defect is caused by tampering, physical abuse or misuse of the product.

- » Itron specifically disclaims all implied warranties including those of merchantability or of fitness for a particular purpose. Under no circimstances will Itron be liable for incidental or consequential damages of any kind what so ever.
- » Itron's liability for any claim of any kind, including negligence and breach of warranty for the sale and use of any product covered by or furnished, shall in no case exceed the price allocable to the product or part thereof which gives rise to the claim.
- » In the event of a malfunction of the product, consult your Itron Service Representative or Itron Inc., 970 Highway 127 North, Owenton, Kentucky 40359-9302. See Itron Terms and Conditions of Sale for the full and complete terms of the Limited Warranty.

ORDERING INFORMATION

Specify:

- 1. Inlet and Outlet Connection Size and Type
- 2. Model Number
- 3. Outlet pressure desired
- 4. Pilot needed
- 5. Inlet pressure range
- 6. Type of gas and maximum capacity required
- 7. Assembly position number (see chart below)
- 8. Special requirements such as tagging, 1/8" pipe plug tap, seal wire, etc.
