

# ORENDA GRINDER INTRODUCTION & TROUBLESHOOTING

Orenda's patented grinder is made out of stainless steel flat burr.

## What's unique about our grinder?

1

### CONSISTENCY

Orenda grinder has an actual mechanism that captures powder like coffee and blocks them from being used so that it doesn't over extract which results to a very bitter taste in your cup of coffee.

2

### QUALITY

Orenda grinder has the ability to self-extract and clear the system from coffee leftovers; this is to ensure that your next cup of coffee would taste great and fresh.

## 3 LEVELS OF CLEANING THE GRINDER:

1. Orenda machine automatically clears itself every time you make your cup of coffee.
2. Manual cleaning should be done every 5 cups or so. There's 3 types of manual cleaning: fluid only, fluid and coffee grounds and descaling.
3. The last but most critical level of cleaning is by removing all parts of the machines and cleaning from the inside by brushing out clogged coffee or by using a compressed air canister or vacuum. We do not recommend this cleaning process unless extremely necessary.

## Issues with coffee getting out of the chamber.

If you see big particles of coffee flying out then you could either be using the wrong roast or there's fault with your machine. But if you see small particles of coffee flying out, then it's normal, unfortunately. We tried to minimize as much as possible the effect of static electricity on the coffee, but it's really impossible to get rid of it completely. We are continuously working out on how we can resolve this issue. But the amount of the coffee should be minimal, if a lot of coffee is coming out, that's not normal.
