The "Rocket Fuel" Pasture Problem.

If you are lucky enough to have native grasses in your paddocks, you have a great foundation for your horse's diet. Roughage should form the basis of any good horse diet, supplementing where required and appropriate. Unfortunately, not all pastures are suitable for horses. Many properties were originally cattle farms before being set up for horses. Some pastures are overgrazed, and the plants are stressed. Pastures established for raising cattle are usually sown with high NSC (Non-Structural Carbohydrates). These grasses add bulk quickly so that the cattle can be sold at a relatively young age. The more weight on the cattle, the greater the financial return. This grass is "rocket fuel" for horses.

We expect our horses to be athletic, healthy, and calm. We want them willing partners, living long and full lives. We need to provide them with a species-specific diet to support good health. A horse's digestive system is meant to graze up to 18 hours per day. The digestive tract is kept full of digesta, slowly moving from one end of the horse to the other by way of peristalsis. This is perfect when the horse is grazing on native grasses containing low sugar and limited fructans. Unfortunately, horses that are not on suitable pastures may have significant problems coping with the "rocket fuel" grass. Whilst many horses are not diagnosed with EMS, Laminitis, Obesity, or Insulin Resistance, they are still showing signs that the grass is too "rich" for them. Symptoms can include behavioural issues, digestive problems, stiff gait, intermittent foot soreness, excessive weight gain and inflammation.

Managing this problem correctly should focus on limiting access to the problem pasture when NSC levels are high, especially during times of rapidly growing grass. Along with restriction of excess NSC, supplementing with EquiMetaBalance will be beneficial.

EquiMetaBalance is formulated to assist in glucose homeostasis and insulin sensitivity. Ingredients include Ginger, Astragalus, Ashwagandha, Fenugreek, Cinnamon, Rhodiola, Aloe Vera, Chromium, L-Tyrosine, Magnesium and Palatinose. The combination of these ingredients works synergistically to reduce inflammation, have antioxidant effect, regulate glucose levels, downgrade stress (laminitis trigger), reduce adiposity in obesity cases and a reduction of lactate after exercise.

Call HiForm to discuss your specific needs. We can provide a complimentary nutritional analysis and discuss dosage for [EquiMetaBalance](#).

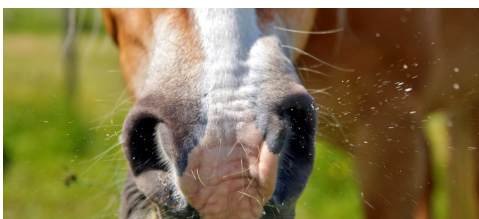

LOOKING FORWARD TO SEEING YOU AT EQUITANA

NATURAL WAY TO HAVE YOUR HORSE FEELING & BREATHING BETTER

Hi Form's Breathe

Breathe is an all natural herbal and herbal extract combination to support respiratory function. The formula has antitussive, anti-inflammatory, mucilaginous and antibacterial properties to support soothing and healing of the airways and encourage normal respiratory function.

- Assists with respiratory function
- Ideal for horses stabled for long periods
- Suited to horses in dusty environments
- Ideal for horses who may be coughing

PetArk Petbiotics

PetArk PetBiotics helps to restore and maintain health in the digestive system, the bacterial flora and the mucosal function. PetBiotics is a pre and pro-biotic formula which may assist with; symptomatic relief from ulcers, removal or mycotoxins, intestinal inflammation, plus providing relief from allergies and much more.

The gut microbiome is associated with the gut-brain axis, skin health, behaviour and immune function. A happy gut microbiome can be achieved through a balanced diet with pre and probiotics when required.
