

Hairs To You

Beware: You may soon see a sudden surge in the number of male clients entering your salon. Lexington International has just received United States Food & Drug Administration (FDA) clearance for their hand-held medical laser device, the HairMax LaserComb. The first chemical-free alternative for combating hair loss, HairMax is an easy to use at-home device clinically proven to grow an average of 19

new thick hairs per square centimeter in six months—sans side effects.

The HairMax LaserComb uses a patented technology to part the hair allowing the focused laser energy to reach the scalp at the optimal wavelength and energy level needed to deliver maximum results. Lexington's study of the device on women is wrapping up and the data will be submitted to the FDA shortly.
