

FAQ: Removing Fill Valve

Please turn your water off and empty the tank before starting!

Once the water is off and the tank is empty, you can remove the waterline from the back of the toilet. Have a bucket or towels handy as there may still be water in the line.

On the back of the toilet, where the waterline was connected, there is a white plastic nut. If you unscrew this, the fill valve will be able to be removed from the toilet tank.
