Liquid Glass Protection  
for **Mobile Devices**

USER GUIDE (EN)

## NanoGo Liquid Glass Protection for Mobile Devices

English

Bluebiit NanoGo Liquid Glass Protection is based on nanotechnology and has been specially formulated to make screens scratch proof. Bluebiit NanoGo Liquid Glass Protection provides a resistive layer that protects screens from scratches and protects you from radiation. This nano-scale layer makes dirt, oil and dust easily removable and also stops bacterial growth on your mobile device.

### Safety first

1. Before applying the product make sure your device power is switched off and disconnected from external power sources.
2. Any external screen protectors, cases and cables such as USB cables, headphones etc. must be disconnected from your device.
3. Do not freeze the product. Application temperature is from +5C° to +30C°.
4. De-moisturises skin. It is recommended that people with sensitive skin wear gloves during application.
5. Cleaning wipe (sachet 1) and coating wipe (sachet 2) contain an organic ethanol propellant. You should therefore test the colourfastness on a small inconspicuous area of your device before application, particularly rubberized surfaces and painted surfaces.
6. Flammable. Keep away from sources of ignition, fire, direct sunlight. Do not smoke.

7. Keep the product away from children.
8. If any of the liquids in this product come into contact with you eyes, rinse thoroughly with water and seek medical attention. If any of the liquids are swallowed seek medical attention. Do NOT induce vomiting. Take this user guide with you.

### 1. Clean

Wipe the surface of the mobile device/screen you want to protect thoroughly with the alcohol cleaning wipe (sachet 1). After 30 seconds wipe with the corner of the enclosed microfiber cloth to ensure that all alcohol droplets have been removed. Before proceeding to the next step make sure that no grease or fingerprints remain.

### 2. Protect

Open sachet 2 and use the coating wipe on the device/screen you want to protect for 90 seconds. Ensure the entire surface is covered by wiping from edge to edge in a circular motion.

Allow the surface to dry for a minimum of 15 minutes.

### 3. Polish

Polish the screen with the "clean" side of the microfiber cloth. Then wash your hands. The surface will tolerate light handling and usage after 30 minutes. However, full protection will only be achieved after 24 hours. We suggest the the application is applied during

the evening. It is recommended that protection treatment is repeated every 12 months. You can test the effectiveness with small water droplets. If the water forms droplets the coating is effective.
