## リJCCB Accesories

A complete range of convenient internal and external accessories for Susol TD and TS series

## Simplicity \& Flexibility

## Various kinds of accessories for user convenience

Internal auxiliaries (AX, AL, SHT, UVT) are the same for all frame size. And trip units, Handles, Locking devices are the same for a given frame size.

## Susol UL Circuit Breaker System Overview

## Gusol U. MMCCB Internal accessories

## ■ Simplicity

The range of internal accessories of TD \& TS series circuit breakers is characterized by common use regardless of frame size and is allowing reduction of stocks.

## Internal accessories

## Common use to all Susol TD and TS circuit breakers

## Electrical auxiliaries that are installed internally are common from 15A to 800A.

## Alarm Switch (AL)

Alarm switches offer provisions for immediate audio or visual indication of a tripped breaker due to overload, shortcircuit, operation of shunt trip, or undervoltage trip conditions, operation of push button.
They are particularly useful in automated plants where operators must be signaled
about changes in the electrical distribution system. This switch features a closed contact when the circuit breaker is tripped automatically. In other words, this switch does not function when the breaker is operated manually. Its contact is open when the circuit breaker is reset.

## Auxiliary Switch (AX)

Auxiliary switch is for applications requiring remote "ON" and "OFF" indication. Each switch contains two contacts having a common connection.

One is open and the other closed when the circuit breaker is open, and viceversa.

## Undervoltage trip (UVT)

The undervoltage trip automatically opens a circuit breaker when voltage drops to a value ranging between $35 \%$ to $70 \%$ of the line voltage. The operation is instantaneous, and the
circuit breaker cannot be reclosed until the voltage returns to $85 \%$ of line voltage. Continuously energized, the undervoltage trip must be operating be fore the circuit breaker can be closed.

## Shunt Trip (SHT)

The shunt trip opens the mechanism in response to an externally applied voltage signal. LS shunt trips include
coil clearing contacts that automatically clear the signal circuit when the mechanism has tripped.

## Susol U/ N/CCD External accessories

## $\square$ Convenience

Wide range of external accessories provides convenient solution for easy installation.

## External accessories

## Extended rotary handle

There are 3 types of length
12/16/24inch

## Flange handle (Cable operating handle)

There are 4 types of length
36/48/60/72inch at each AF

## Locking device

- Fixed padlock
- Removable padlock

## Mechanical interlocking device

Interlocks prevent connection to both sources
at the same time, even momentarily.

## Susol UL MCCB wandiaracemics

Susol series circuit breakers are suitable for

- Protection of power distribution
- Controlling and disconnecting circuits

## ■ Optimum technical support for

(Cascading, Discrimination, Type 2 coordination) *

- Selecting economical protection system
- Quarantee safety of the installation
- Reducing the stress on components and damage
- Guarantee service continuity

## Thermal magnetic trip Overview

Susol TD \& TS series circuit breakers be installed with thermal magnetic trip units.

Some models of the TD\&TS series circuit breakers are UL Listed to be applied at up to $100 \%$ of their current rating. Because of the additional heat generated, the use of speciallydesigned enclosures and $90^{\circ} \mathrm{C}$ rated wire and the wire size are required when applying circuit breakers at $100 \%$ of continuous current rating.

## Function

Protection of power distribution

- Overload protection: Thermal protection with a fixed or adjustable threshold
- Built-in trip units for TD \& TS series

Markings on the circuit breaker indicate the minimum enclosure size and ventilation required. The $90^{\circ} \mathrm{C}$ wire size shall be based on the ampacity of the $75^{\circ} \mathrm{C}$ wire as indicated on UL489. Circuit breakers with 100\% rating can also be used in applications requiring only 80\% continuous loading.

- Short-circuit protection: Magnetic protection with a fixed or adjustable pick-up

## Operation

## Thermal magnetic types

- Time-Delay operation

An overcurrent heats and warps the bimetal to actuate the trip bar by the bimetal characteristic.

- Instantaneous operation

If the overcurrent is excessive, the armature is attracted and the trip bar actuated by electromagnetic force.

## Ratings

## TS250U MTU

## Molded case switch

## Susol

The Molded case switch are different from the circuit-breakers in the absence of the conventional protection unit. They keep the overall dimensions, connection systems and accessories unchanged from the
corresponding circuit-breakers Installation standards require upstream protection. However, thanks to their high-set magnetic release, TD125U ... TS800U MCS are self protected.

UVT

## Electrical auxiliaries

The following devices are installed into all TD \& TS circuit breakers regardless of frame size. And, the electrical auxiliaries can be easily
installed in the accessory compartment of the circuit breakers which is cassette type.

## Undervoltage release, UVT

The undervoltage release automatically opens a circuit breaker when voltage drops to a value ranging between $35 \%$ to $70 \%$ of the line voltage. The operation is instantaneous, and after tripping, the circuit breaker cannot be reclosed again until the voltage returns to $85 \%$ of line voltage.

Continuously energized, the undervoltage release must be operating before the circuit breaker can be closed. The undervoltage release can be easily installed in the left accessory compartment of the Susol TD and TS circuit-breakers.

- Range of tripping voltage: $0.35 \sim 0.7 \mathrm{Vn}$
- MCCB making is possible voltage: 0.85 Vn (exceed)
- Frequency (only AC): $45 \mathrm{~Hz} \sim 65 \mathrm{~Hz}$

## Accessories

## Electrical auxiliaries

SHT

## Shunt release, SHT

The shunt release opens the mechanism in response to an externally applied voltage signal. The releases include coil clearing contacts that automatically clear the signal circuit when the mechanism has tripped.

- Range of operational voltage: $0.7 \sim 1.1 \mathrm{Vn}$
- Frequency (only AC): $45 \mathrm{~Hz} \sim 65 \mathrm{~Hz}$

The shunt release can be installed in the left accessory compartment of the Susol TD \& TS circuit-breakers

## How to use

The locking device for the toggle handle is designed to be easily attached to
the front of circuit-breaker.
(1) Please set the toggle handle in the position of "On" or "Off".
(2) Install the lock device onto the front of auxiliary cover of circuit breaker.
(3) Folding the wings of lock device as shown in picture 3.
(4) The padlock to be used shall be that which is commercially available with the nominal dimension.
(1.2inch ( 30 mm ), nominal dimension, $0.2 \sim 0.3$ inch ( $5 \sim 8 \mathrm{~mm}$ ) diameter)

## Accessories

## Interlock

## Operation

Left MCCB: ON/OFF is possible Right MCCB: Off lock

Left MCCB: Off lock
Right MCCB: ON/OFF is possible

Both MCCBs are of locked

## Mechanical interlocking device

The mechanical interlock (MIT) can be applied on the front of two breakers mounted side by side, in either the 3-pole version and prevents simultaneous closing of the two breakers.

Fixing is carried out directly on the cover of the breakers.

The front interlocking plate allows installation of a padlock in order to fix the position. (possibility of locking in the O-O position as well)

This mechanical interlocking device is very useful and simple for consisting of manual source-changeover system.

## Temperature derating

A derating of the rated operational current of the Susol TD and TS molded case circuit breaker is necessary if the ambient temperature is greater than $40^{\circ} \mathrm{C}$. Namely, when the ambient temperature is greater than $40^{\circ} \mathrm{C}$, overload-protection characteristics are slightly modified.

Electronic trip units are not affected by variations in temperature.
But, the maximum permissible current in the circuit breaker depends on the ambient temperature.

## Application

Primary use of transformer

## Application for transformer protection

Transformer excitation surge current may possibly exceed 10 times rated current, with a danger of nuisance tripping of the MCCB. The excitation surge current will vary depending upon the supply phase angle at the time of switching, and also on the level of core residual magnetism.

So, it's recommended to select proper circuit breakers according to the continuous current carrying capacity of transformer. It requires to consider separately whether transformer is single phase or three phase. The below table indicates the proper molded case circuit breaker suitable for each transformer.

AC240V

## Application

Primary use of transformer

## Application for transformer protection (MCCBs for Transformer-Primary Use)

Transformers are used to change in the supply voltage, for both medium and low voltage supplies.
The choice of the protection devices should be considered transient insertion phenomena, during which the current may reach values higher than the rated full load current; the phenomenon decays in a few seconds.

The peak value of the first half cycle may reach values of 15 to 25 times the effective rated current. For a protective device capable of protecting these units this must be taken into account. Manufacturers data and tests have indicated that a protective device feeding a transformer must be capable of carrying the following current values without tripping.

## Application <br> Protection of lighting \& heating circuits

In the lighting \& heating circuits, switchingsurge magnitudes and times are normally not sufficient to cause serious tripping problems. But, in some cases, such as incandescent lamps, mercury arc lamps, metal halide and sodium vapour, or other large starting-current equipment, the proper selection should be considered.

Upon supply of a lighting installation, for a brief period an initial current exceeding the rated current (corresponding to the power of the
lamps) circulates on the network. This possible peak has a value of approximately $15 \div 20$ times the rated current, and is present for a few milliseconds; there may also be an inrush current with a value of approximately $1.5 \div 3$ times the rated current, lasting up to some minutes. The correct dimensioning of the switching and protection devices must take these problems into account. Generally, it is recommended to make the maximum operating current not to exceed $80 \%$ of the related current.

## Technical information

## Application

## Protection of resistance welding circuits

Short circuit protection for resistance welding devices can be obtained by applying molded case circuit breaker properly. These breakers permit normally high welding currents, but trip
instantaneously if a short circuit develops. It's recommended to select proper circuit breaker according to the characteristics of welding devices as the follow table.

| Characteristics of welding device |  | Applied circuit breaker (MCCB 2P) |  |
| :---: | :---: | :---: | :---: |
| Capacity (kVA) | Maximum input (kVA) | 240 V (Single phase) | 415 V (Single phase) |

## Application Use of circuit-breakers for capacitor banks

Capacitor circuit

Usual connection diagram

## Application for protection of capacitor circuit

In order to reduce system losses (less than $0.5 \mathrm{~W} / \mathrm{kvar}$ in low voltage) and voltage drops in the power distribution system, reactive power compensation or power factor correction is generally undertaken. As a result, the power fed into the system is used as active power and costs will be saved through a reduction in

Examples of equipment which consume reactive energy are all those receivers which require magnetic fields or arcs in order to operate, such as:

- Asynchronous motors: An asynchronous motor is a large consumer of inductive reactive energy. The amount of reactive power consumed is between $20 \%$ and $25 \%$ of the rated power of the motor (depending on its speed).
- Power Transformers: Power transformers are normally always connected. This means that reactive energy is always consumed. Also, as a consequence of its inductive nature, the reactive energy increases when the transformer is loaded.
- Discharge lamps, Resistance-type soldering machines, Dielectric type heating ovens, Induction heating ovens, Welding equipments, Arc furnaces
the capacitive and inductive power factors. The compensation can be carried out by the fixed capacitors and automatic capacitor banks. However, the disadvantages of installing capacitors are sensitivity to over-voltages and to the presence of nonlinear loads.

At the instant of closing a switch to energize a capacitor, the current is limited only by the impedance of the network upstream of the capacitor, so that high peak values of current will occur for a brief period, rapidly falling to normal operating values.

According to the relevant standards IEC 60831-1/IEC 70, capacitors must function under normal operating conditions with the current having a RMS value up to 1.3 times the rated current of the capacitor. Additionally, a further tolerance of up to $15 \%$ of the real value of the power must be taken into consideration. The maximum current with which the selected circuit-breaker can be constantly loaded, and which it must also be able to switch, is calculated as follows:

Maximum expected rated current $=$ Rated current of the capacitor bank $\times 1.5$ (RMS value)

## Application

## Circuit breakers for 400 Hz networks

When circuit breakers are used at high frequencies, the breakers in many cases require to be derated as the increased resistance of the copper sections resulting from the skin effect produced by eddy currents at 400 Hz .

- Standard production breakers can be used with alternating currents with frequencies other than $50 / 60 \mathrm{~Hz}$ (the frequencies to which the rated performance of the device refer, with alternating current) as appropriate derating coefficients are applied.

## Thermal magnetic trip

## Thermal trip

As can be seen from the data shown in below, the tripping threshold of the thermal element (In) decreases as the frequency increases because of the reduced conductivity of the

## Instantaneous trip

The magnetic threshold increases with the increase in frequency.
materials and the increase of the associated thermal phenomena.

Notes) The above mentioned technical data is defined under the usage conditions as follows ;

1. The circuit breaker is tripped within 10 seconds in $600 \%$ of the current of the fully operating loads
2. The start-up input current is set within $1700 \%$ of the current of the fully operating loads
3. The capacity of highest motor is also applied when several loads starts up simultaneously.

## Technical information

## Susol

## Protective coordination Discrimination \& Cascading

The primary purpose of a circuit protection system is to prevent damage to series connected equipment and to minimize the area and duration of power loss.
The first consideration is whether an air circuit

## Discrimination

## Total discrimination (total selectivity)

Over-current discrimination where, in the presence of two over-current protective devices in series, the protective device on the

Partial discrimination (partial selectivity)
Over-current discrimination where, in the presence of two over-current protective devices in series, the protective device on the

## No discrimination

In case of a fault, main and branch circuit breakers open.

## Cascading

This is an economical approach to the use of circuit breakers, whereby only the main (upstream) breaker has adequate interrupting capacity for the maximum available fault current.
The MCCBs downstream cannot handle this maximum fault current and rely on the opening of the upstream breaker for protection.
The advantage of the cascade back-up
breaker or molded case circuit breaker is the most suitable. The next is the type of system to be used.
The two major types are: Discrimination and cascading.
load side effects the protection without causing the other protective device to operate.
load side effects the protection up to a given level of over-current, without causing the other protective device to operate.
approach is that it facilitates the use of low cost, low fault level breakers downstream, thereby offering savings in both the cost and size of equipment.
As Susol TD \& TS circuit breakers have a very considerable current limiting effect, they can be used to provide this 'cascade back-up' protection for downstream circuit breakers.

## How to calculate short-circuit current value Various short-circuit

The purpose of calculating short circuit values

- Selection of circuit breakers, fuse.
- Adjusting metering devices
- Consideration for mechanical resistance
- Consideration for thermal resistance

Various value of short-circuit current should be applied to the tests for upper factors.
Symmetrical current for AC and asymmetrical current for DC are used for classifying short circuit current.
Their differences should be essentially considered in the basic step of making network plan.

## Symmetrical short-circuit current real value

Short-circuit current is composed of AC and DC as it shows on <Fig.1>. The short-circuit which indicates the real value of AC is called as symmetrical short-current real value, I (rms)sym. This current is the essential factor of selecting MCCB, ACB, fuse.

<Fig.1> Composition of short-circuit current

## Maximum asymmetrical short-circuit current real value: I (rms)asym

The short-circuit which indicates the real value of DC is called as asymmetrical short-circuit current real value.
And this current value is changeable upon the short-circuit closing phase.
This current value is treated for checking the thermal resistant strength of wrings, CT and etc.
With symmetrical short-circuit current real value and short-circuit power factor, we can achieve the value, $\alpha$ from <Fig. $5>$.
and maximum asymmetrical short-circuit current real value is calculated with this formula.

3-phases average asymmetrical shortcircuit current real value: I (rms)ave
Each phase is different in its input current value in 3 phases circuit. So that AC rate for 3 phases is different. This value is the average of asymmetrical short-circuit current of 3 phases.
And with symmetrical short-circuit current real value and short-circuit power factor, we can achieve the value, $\beta$, and 3 -phases average asymmetrical short circuit current real value is calculated with this formula.

$$
\text { I (rms)ave }=\beta \text { I (rms)sym }
$$

## Maximum asymmetrical short-circuit current instantaneous value: Imax

Each phase has different instantaneous current value. And when asymmetrical short-circuit current shows its maximum instantaneous value, the current value is called as maximum asymmetrical short-circuit current instantaneous value. This current is to test the mechanical strength of serial equipments.
And with symmetrical short-circuit current real value and short-circuit power factor, we can achieve the value, $\gamma$ and maximum asymmetrical short-circuit current instantaneous value is calculated with this formula.

$$
\operatorname{lmax}=\gamma \mid(\mathrm{rms}) \text { sym }
$$

## Network impedance for calculating shortcircuit current value

Bellows should be considered for the calculation as the impedance components affecting circuit to trouble spot from shortcircuit power.
a. Primary part impedance of incoming transformer It's calculated from the shortcircuit current data which is provided by power supplier. Calculated value can be regarded as reactance.
b. Impedance of incoming transformer Its amount is upon the capacity of transformer and primary voltage. Generally this impedance can be regarded as reactance and refer to <Table.4>, <Table.5>.

## Technical information

## How to calculate short-circuit current value Various short-circuit

c. Reactance of motor

Motor works as generator and supply short circuit current in the condition of an accident circuit such as <Fig.2>.
Generation factor of firm motor should be considered in a low voltage circuit where a circuit breaker operates quickly and in a high voltage circuit for the selection of fuse. Reactance of motor can be regarded in the range of $25 \%$ normally.
d. Distribution impedance Impedance of cable and busduct do control short-circuit remarkably in low voltage network. Refer to <Table.5>, <Table.6>.
e. Others

MCCB, ACB CT are equipments for the network of low voltage.
The impedance of these equipment which is calculated from short-circuit current value should be considered.
Generally, the impedance of those equipment is that of rated current (normal condition), if operators apply that impedance value, bigger reactance value may be applied to calculated short-circuit current value.

<Fig.2> Short-circuit of motor

## Technical information

## How to calculate short-circuit current value With percent impedance

Ohm formula ( $\Omega$ ), percent impedance formula (\%), unit formula (per unit) can be applied to calculate short-circuit current value.

## Ohm formula [ $\Omega$ ]

Short-circuit current value is calculated by converting into ohm value [ $\Omega$ ]

Percent impedance formula (\%) Each impedance is converted into the impedance of base value and base voltage.
And the required amount for electric demand should be shown as percent unit.
And apply that value in ohm formula.

## Unit formula

The base value equals 1.0. and all value of network shows in the way of decimal system. Applying any of upper calculation formulas to achieve short-circuit current value, it shows equal value. To select a certain formula for doing it, operator can select one of those formula which is proper to oneself. Below is percent impedance formula.

## Finding base value

The rated current of transformer shall be the base value.

Base capacity $\mathrm{P}_{\mathrm{B}}=\mathrm{P}_{\mathrm{T}}[\mathrm{kVA}]$
Base voltage $\mathrm{V}_{\mathrm{B}}=\mathrm{V}_{\mathrm{T}}[\mathrm{V}]$
Base current $I_{B}=I_{T}=\frac{\mathrm{P}_{\mathrm{T}}}{\sqrt{3 \mathrm{~V}_{\mathrm{T}}}} \times 10^{3}[\mathrm{~A}]$
Base impedance $Z_{B}=\frac{V_{B}{ }^{2}}{\mathrm{P}_{\mathrm{B}} \times 10^{3}}=\frac{\mathrm{V}_{\mathrm{T}}{ }^{2}}{\mathrm{P}_{\mathrm{T}} \times 10^{3}}[\Omega]$

<Fig.3> Base value

## Converting impedance into base value

a. Primary part impedance of transformer: \% X
$\% X_{1}=\frac{\mathrm{P}_{\mathrm{B}}}{\mathrm{Q} \times 10^{3}} \times 100[\%]$
Q: Primary part short-circuit capacity
b. Impedance of transformer: \%ZT

It generally indicates as percent impedance. If base capacity is equal to transformer capacity, \%ZT can be used as it is. When base capacity is not equal to transformer capacity, convert values by this formula.
$\frac{P_{T}}{\%_{\mathrm{T}}}=\frac{\mathrm{P}_{\mathrm{B}}}{\%_{\mathrm{B}}}$
\%: value converted by base value
1 phase transformer should converted into the value of 3 phase transformer, And the percent impedance is equal to $\frac{\sqrt{3}}{2} \times$
calculated urgent value.
c. Reactance of motor: \%Xm

Transformer capacity shows the value in kW, so it is converted into unit, kVA.
(kVA value) $\fallingdotseq 1.5 \times$ (Output of motor, kW )
\%Xm=25\% Converting it from base capacity
$\frac{\mathrm{P}_{\mathrm{m}}}{\% \mathrm{Xm}}=\frac{\mathrm{P}_{\mathrm{B}}}{\% \mathrm{Xm}}$
(Converting formula for different capacity)
d. Impedance of busduct, cable

Cable: Area of cross-section \& length
Busduct: Rated current
In <Fig.5>, <Fig.6>
$Z_{\mathrm{c}}=(\Omega$ per each unit length $) \times($ length $)[\Omega]$
Convert this value into \% value.
$\%_{Z_{c}}=\frac{Z_{c}}{Z_{\mathrm{B}}}$
(\% converting formula)
2cables in same dimension, it's recommendable to divide the length by 2.

## Technical information

## How to calculate short-circuit current value

## Preparing a impedance map

Prepare impedance map according to the impedance value from (2). Various electricity suppliers like source, motor have same electric potential in impedance map.
As you find it on <Fig.4> (a), extend it from the unlimited bus to fault point, draw impedance map.

## Calculating impedance

Calculate impedance as <Fig. 4 (b)> in impedance map < Fig. 4 (a)> $\% Z=\% R+j \% X$
$\% Z=\sqrt{(\% R)^{2}+(\% X)^{2}}$

## Calculating symmetrical short-circuit current real value

<Fig.4> Base value

## Calculating various short-circuit current

 value$\mathrm{IF}(3 \varnothing)=\mathrm{IF}(\mathrm{rms}) \operatorname{sym}(3 \varnothing)$

$$
\begin{aligned}
& =\frac{P_{B} \times 10^{3}}{\sqrt{3} V_{B} \cdot \% Z} \times 100 \\
& =\frac{I_{B}}{\% Z} \times 100[A]
\end{aligned}
$$

Calculate various short-circuit current value with $\alpha, \beta, \gamma$ values from <Fig. $5>$ like short-circuit power factor $\cos \varnothing=\frac{\% R}{\% Z}$
3 phases average asymmetrical real value $\mathrm{I}_{\mathrm{F}}(\mathrm{rms})$ ave $=\beta \mathrm{I}_{\mathrm{F}}(\mathrm{rms})$ sym Maximum average asymmetrical real value $\mathrm{I}_{\mathrm{F}}(\mathrm{rms})$ asym $=\Omega \mathrm{I}_{\mathrm{F}}(\mathrm{rms})$ sym Maximum asymmetrical instantaneous value $l_{\text {F }} \max =\gamma \|_{F}(\mathrm{rms})$ sym

## In case of 1 phase short-circuit

Current value from (5) multiplied by $\frac{\sqrt{3}}{2}$ Each short-circuit current value $(1 \varnothing)=\frac{\sqrt{3}}{2}$ (3phases short-circuit current) $\times \alpha$ (or $\gamma$ )

<Fig.5>

## Technical information

## How to calculate short-circuit current value With a simple formula

For its special cases, calculating exact value should be needed, in the other hand, for the practical use, we recommend simple formula.

## Finding a base value

It shall be the rated current of transformer.
$\mathrm{P}_{\mathrm{B}}=\mathrm{PT}[\mathrm{kVA}]$
$\mathrm{V}_{\mathrm{B}}=\mathrm{VT}$ [V]
$\mathrm{I}_{\mathrm{B}}=\mathrm{IT}[\mathrm{A}]$
$\mathrm{Z}_{\mathrm{B}}=\frac{\mathrm{VT}_{\mathrm{B}}[\Omega]}{\mathrm{PT} \times 103}$

<Fig.6> Base value

## Short-circuit current from incoming circuit

Disregard the impedance value of primary part of transformer. Calculate short-circuit current value according to <Fig.7>.
(If the impedance value of primary part of transformer is considered, calculate the current value as below formula)
$I_{A}(R)=\frac{I_{B}}{\sqrt{\left(\% R_{T}\right)^{2}+\left(\% X_{1}+\% X_{T}\right)^{2}}} \times 100[A]$
$\% X_{1}=\frac{\mathrm{P}_{\mathrm{B}}}{\mathrm{Q} \times 10^{3}} \times 100[\%]$
If the value of $\% \mathrm{R}_{\mathrm{T}}$ is not clear, $\% \mathrm{Z}_{T} \fallingdotseq \% \mathrm{~T}_{T}$
$I_{A}(R)=\frac{I_{B}}{\% X_{1}+\%_{T}} \times 100[A]$

Ref 1) Calculation in the random voltage $E$ Voltage line which is mostly close to $E$ shall be selected to calculate it .
i.e. in case of 220 V , ( 200 V line value) $\div 200 / 220$

Ref 2) Calculation for a certain impedance Zt (\%) Impedance line which is mostly close to Zt (\%) shall be selected to calculate it. i.e. $420 \mathrm{~V}, \mathrm{Zt}=4.5 \%$
$\% Z=4 \%$ Line value (or $5 \%$ line) $\times 4$ (or 5)/4.5
Ref 3 ) When the value is out of lines or over 200VA or below 100 kA , multiply 10 times to the calculated values.
<Fig.7> Transformer capacity and short-circuit current

## Short-circuit current to motor

$I_{A}(M)=4 \times \Sigma$ (Rated current of motor)

## Symmetrical short-circuit current at point $A$

 $I_{A}=I_{A}(R)+I_{A}(M)$
## Decreasing coefficient caused by busduct

Obtaining the value of $\frac{l \cdot I_{\mathrm{A}}}{10 \mathrm{VT}}$
Calculate decreasing coefficient from <Fig.10>

## Decreasing short-circuit current by reactance

When there's 1 phase transformer in a certain circuit, calculate it in the base of reactance.
Regarding the reactance as pre-impedance at source part at point of <Fig.8>,
$X_{c}=\frac{E_{B}}{\sqrt{3} l_{c}}$
Reactance C~D: $\mathrm{X}_{\mathrm{D}}[\Omega]$ (impedance of $1 \varnothing \mathrm{~T}$ )

How to calculate short-circuit current value

Calculating the value of $X_{D} / X_{C}$ and decreasing coefficient d from the reactance of <Fig.9>.
Current at point $D l_{o}=d \cdot I_{c}$
Impedance of 1 phase transformer $X_{D}=X(1 \varnothing) \frac{1}{2}$ a. Short-circuit current at Ec voltage base lo (rms)sym $3 \varnothing=\mathrm{d} \cdot \mathrm{Ic}(\mathrm{rms}) \mathrm{sym} \cdot 3 \varnothing$
b. Short-circuit current at Eo voltage base lo (rms)sym $\cdot 3 \varnothing=\mathrm{d} \cdot \mathrm{Ic}_{\mathrm{c}}(\mathrm{rms})$ sym $\cdot 3 \varnothing \times \mathrm{Ec}_{\mathrm{c}} / \mathrm{ED}_{\mathrm{o}}$

<Fig.9> Decreasing coefficient of short-circuit current by reactance: d

## Coefficient d for cables

Calculating the value of $\frac{l \mathrm{lo}}{10 \mathrm{~V}_{T}}$
Decreasing coefficient $b$ value is calculated from <Fig.13>. For insulator drawn wrings, we can find the value directly from <Fig.13>.

## Calculating symmetrical short-circuit current real value

$I_{F}(\mathrm{rms})$ sym $=\mathrm{b} \times \mathrm{lo}_{\mathrm{o}}[\mathrm{D}]$

## Various short-circuit current

In case of having short-circuit current power factor, find $\alpha, \beta, \gamma$ from <Fig.5>, If not find 3 values from <Table.1>

- 3 phases short-circuit asymmetrical current average value
$\mathrm{I}_{\mathrm{F}}(\mathrm{rms})$ ave $=\beta \mathrm{I}_{\mathrm{F}}(\mathrm{rms})$ sym
- Maximum asymmetrical real value $I_{F}(\mathrm{rms})$ ave $=\alpha \mathrm{l}_{\mathrm{F}}(\mathrm{rms}) \mathrm{sym}$
- Maximum asymmetrical instantaneous value $I_{F}(\mathrm{rms})$ ave $=\gamma \mathrm{l}_{\mathrm{F}}(\mathrm{rms})$ sym
<Table.2> $\alpha, \beta, \gamma$ values when short circuit power factor value is not definite.

| Symmetrical <br> short-circuit <br> real value <br> (A) | Variables |  |  |
| :--- | :---: | :---: | :---: |

## Technical information

## Susol

## How to calculate short-circuit current value Calculation example

Calculation1) Short-circuit current value will be achieved by simple formula and percent impedance formula for <Fig.13>

<Fig.13>

## Percent impedance formula

(1) Base value
$\mathrm{P}_{\mathrm{B}}=750 \mathrm{kVA} \quad \mathrm{V}_{\mathrm{B}}=420 \mathrm{~V}$
$\mathrm{I}_{\mathrm{B}}=1031 \mathrm{~A} \quad \mathrm{Z}_{\mathrm{B}}=0.237 \Omega$
(2) Each impedance
a. Reactance at primary part of transformer

$$
\% X_{1}=\frac{750}{1000 \times 10^{3}} \times 100=0.075[\%]
$$

b. Impedance of transformer
\%RT= $1.4 \%$
$\% X_{T}=4.8 \%$
c. $1 \varnothing$ Tr impedance

$$
\begin{aligned}
& \%_{R_{T 1}}=\frac{1.15 \times 750}{20} \times \frac{1}{2}=21.6[\%] \\
& \% X_{T 1}=\frac{1.68 \times 750}{20} \times \frac{1}{2}=31.5[\%]
\end{aligned}
$$

d. Reactance of transformer
$\% X_{m 1}=\frac{750}{120 \times 1.5} \times 25=104[\%]$
$\% X_{m 2}=\frac{750}{140 \times 1.5} \times 25=89[\%]$
$\% X_{m 3}=\frac{750}{100 \times 1.5} \times 25=125[\%]$
$\% X_{m 4}=\frac{750}{115 \times 1.5} \times 25=108.7[\%]$
e. Impedance of cable

Converting impedance of whole metal tube
$\left[\begin{array}{ll}2 \times 100 \mathrm{~mm}^{2} & 10 \mathrm{~m}\end{array}\right]$
$\% R_{c 1}=\frac{0.00018 \times 10}{0.237} \times \frac{1}{2} \times 100=0.38[\%]$
$\% \mathrm{Xc}_{\mathrm{c} 1}=\frac{0.00013 \times 10}{0.237} \times \frac{1}{2} \times 100=0.27[\%]$
[125mm 20m]
$\% R_{\mathrm{c} 2}=\frac{0.00014 \times 20}{0.237} \times 100=1.18[\%]$
$\% X_{c 2}=\frac{0.00013 \times 20}{0.237} \times 100=1.09[\%]$
[250mm² 50m]
$\% R_{c 3}=\frac{0.00007 \times 50}{0.237} \times 100=1.47[\%]$
$\% X_{c 3}=\frac{0.00013 \times 50}{0.237} \times 100=2.74$ [\%]
[14mm $\left.{ }^{2} \quad 30 \mathrm{~m}\right]$
$\%_{\mathrm{R}_{\mathrm{c} 4}}=\frac{0.00013 \times 30}{0.237} \times 100=16.45[\%]$
$\% X_{c 4}=\frac{0.00015 \times 30}{0.237} \times 100=1.88[\%]$

## How to calculate short-circuit current value

(3) Preparing a impedance map

Connect short-circuit supplier to the unlimited bus.

<Fig.14>

## Calculating impedance

Calculate it in serial/parallel type formula

<Fig.15>

(5) Calculation of asymmetrical short-circuit current
a. Fault point $F_{1}$
$I_{\text {F1 }}(\mathrm{rms})$ sym $=\frac{1031}{6.1} \times 100=16900[A]$ $\cos \varnothing_{1}=\frac{2.57}{6.1}=0.422$
b. Fault point $\mathrm{F}_{2}$ (1 phase circuit)
$\mathrm{IF}_{2}$ (rms) sym $=\frac{1031}{54.2} \times 100=1902[\mathrm{~A}] \cdots$ (at 100V)
$=\frac{1031}{54.2} \times 100 \times \frac{420}{100}=7989[\mathrm{~A}] \cdots$ (at 420 V )
$\mathrm{IF}_{2}$ (rms)sym is short-circuit current.
Therefore, convert it into 1 phase short-circuit current.
$\mathrm{IF}_{2}(\mathrm{rms}) 1 \Omega$ sym $=7989 \times \frac{\sqrt{3}}{2}=6919[\mathrm{~A}]$ $\cos \varnothing_{2}=\frac{39.06}{54.2}=0.72$
(6) Various short-circuit current

Calculate $\alpha, \beta, \gamma$ from <Fig.5>.
a. Fault point $F_{1}$ $\cos \varnothing_{1}=0.422$
$\alpha=1.05 \quad \beta=1.3 \quad \gamma=1.74$
$\mathrm{I}_{\mathrm{F} 1}(\mathrm{rms})$ ave $=1.03 \times 16900=17407$ [A]
$\mathrm{I}_{\mathrm{F} 1}(\mathrm{rms})$ asym $=1.05 \times 16900=17745$ [A]
$\mathrm{I}_{\text {F1 }} \max =1.74 \times 16900=29406[A]$
b. Fault point $\mathrm{F}_{2}$
$\cos \varnothing_{2}=0.72$
$\alpha=1.0 \quad \beta=1.48$
$\mathrm{I}_{\mathrm{F} 2} 1 \varnothing(\mathrm{rms}) \mathrm{asym}=1.0 \times 6919[\mathrm{~A}]$
$\mathrm{I}_{\mathrm{F} 2} 1 \varnothing \mathrm{max}=1.48 \times 6919=10240$ [A]

## Simple calculation formula

(1) Base value
$\begin{array}{ll}\mathrm{P}_{\mathrm{B}}=750 \mathrm{kVA} & \mathrm{V}_{\mathrm{B}}=420 \mathrm{~V} \\ \mathrm{I}_{\mathrm{B}}=1031 \mathrm{~A} & \mathrm{Z}_{\mathrm{B}}=0.237 \Omega\end{array}$
(2) Short-circuit current of incoming circuit Disregard the impedance of primary part of transformer
In $<$ Fig. $7>\mathrm{I}_{\mathrm{A}(\mathrm{R})}=20500 \mathrm{~A}$
(3) Short-circuit current of motor Sum of motor capacity= $(120+140+100+115) \times 1.5=713[\mathrm{kVA}]$
$I_{A(M)}=\frac{713}{\sqrt{3} \times 420} \times 4=3920$ [A]
(4) Symmetrical short-circuit current at point A $I_{A}=20500+3920=24420$ [A]

## Technical information

## Susol

## How to calculate short-circuit current value Calculation example

(5) Decreasing short-circuit current for cable
a. At point $\mathrm{F}_{1}$

- $2 \times 100 \mathrm{~mm}^{2} 10 \mathrm{~m}$ $2 \times 100 \mathrm{~mm}^{2} 10 \mathrm{~m}=100 \mathrm{~mm}^{2} 5 \mathrm{~m}$

$$
\frac{l \mathrm{I}_{\mathrm{A}}}{10 \mathrm{E}}=\frac{20 \times 24420}{10 \times 420}=29.1
$$

Coefficient b=0.935
Short-circuit current value at point C lc $(\mathrm{rms}) \mathrm{sym}=0.935 \times 24420=22850[\mathrm{~A}]$

- $125 \mathrm{~mm}^{2} 20 \mathrm{~m}$

$$
\frac{l \mathrm{I}_{\mathrm{c}}}{10 \mathrm{E}}=\frac{20 \times 22850}{10 \times 420}=108.9
$$

$\mathrm{IF}_{\mathrm{F} 1}(\mathrm{rms}) \mathrm{sym}=0.785 \times 244850=17940[\mathrm{~A}]$
b. At point $\mathrm{F}_{1}$

- $14 \mathrm{~mm}^{2} 30 \mathrm{~m}$
$\frac{l \mathrm{Ic}}{10 \mathrm{E}}=\frac{30 \times 24420}{10 \times 420}=174.4$
Coefficient b=0.249
$\mathrm{lo}_{\mathrm{o}}(\mathrm{rms}) 3 \varnothing$ sym $=0.24 \times 24420=6080[\mathrm{~A}]$
- Decreasing by the reactance ( $1 \varnothing$ Tr)dp Convert the value of ' $\% \mathrm{X}$ of $1 \varnothing \mathrm{Tr}^{\prime}$ to base capacity
Xo= $750 \times 2 / 20=75 \%$
Impedance of primary part at $1 \varnothing \mathrm{Tr}$
$X A=\frac{I_{B}}{I_{D}} \times 100=\frac{1031}{6080} \times 100[\%]$
Convert $X_{o}$ to equivalent 3 phases, and
$\frac{X_{0} / 2}{X_{A}}=\frac{750 \times 2 \times 6080}{20 \times 2 \times 1031 \times 100}=2.21$
Coefficient d of <Fig.9> d= 0.32 $\mathrm{l}=2(\mathrm{~ms}) 3 \varnothing \mathrm{sym}=0.32 \times 6080=1945[\mathrm{~A}](400 \mathrm{~V})$ $=0.32 \times 6080 \times 420 / 100$ $=817[\mathrm{~A}](100 \mathrm{~V})$
$\therefore \mathrm{IF}_{\mathrm{F}}(\mathrm{rms}) 1 \varnothing$ sym $=8171 \times \frac{\sqrt{3}}{2}=7076[\mathrm{~A}]$
(6) Various short-circuit current Find $\alpha, \beta, \gamma$ from <Table.1> a. At point $F_{1}$
$\alpha=1.25 \quad \beta=1.13 \quad \gamma=2.17$
IF1 (rms)ave $=1.13 \times 17940=20272$ [A]
IF1 (rms)asym $=1.25 \times 17940=22425$ [A]
IF1max $=2.17 \times 17940=38930[A]$
b. At point $\mathrm{F}_{2}$
$\alpha=1.13 \quad \gamma=1.94$
IF21 $\varnothing$ (rms)asym $=1.13 \times 7076=7945$ [A]
IF21 $\varnothing$ max $=1.94 \times 7076=13727$ [A]

| Fault point |  | $\mathrm{F}_{1}$ | $\mathrm{F}_{2}$ |
| :---: | :---: | :---: | :---: |

## How to calculate short-circuit current value

Short-circuit current value will be achieved by simple formula for <Fig.16>

<Fig.16>
(1) Calculate rated current at each point
(1) Rated current $\operatorname{lnA}_{A}$ at point $A$

$$
\mathrm{I}_{\mathrm{nA}}=\frac{500[\mathrm{kVA}] \times 1000}{\sqrt{3} \times 6.6[\mathrm{kV}] \times 1000}=43.7[\mathrm{~A}]
$$

(2) Rated current $I_{n B}$ at point B

$$
\begin{aligned}
& \operatorname{In}=\frac{100[\mathrm{kVA}] \times 1000}{\sqrt{3} \times 3.3[\mathrm{kV}] \times 1000}=17.5[\mathrm{~A}] \\
& \operatorname{Inc}=\frac{20[\mathrm{~kW}] \times 1000}{\sqrt{3} \times 220[\mathrm{~V}] \times 0.85 \times 0.8}=77.2[\mathrm{~A}]
\end{aligned}
$$

(2) Put 1000 k VA for base capacity and calculate short-circuit current at each point.
(1) Short-circuit current lsA at point A a) Impedance Map

b) Short-circuit IsA

$$
\mathrm{I}_{\mathrm{SA}}=\frac{1000[\mathrm{kVA}] \times 1000 \times 100}{\sqrt{3} \times 6.6[\mathrm{kV}] \times 1000 \times 0.25 \%}=34990[\mathrm{~A}]
$$

* Breaking capacity of breaker [MVA] MVA= 3 short-circuit current $[k A]$ line to line voltage[kV]
(2) Short-circuit current at point B: Iss
a) Impedance Map
* Serial sum of impedance

Ztot $=0.25+0.01+8=8.26[\%]$

b) Short-circuit current Isc

$$
\mathrm{I}_{\mathrm{ss}}=\frac{1000[\mathrm{kVA}] \times 1000 \times 100}{\sqrt{3} \times 3.3[\mathrm{kV}] \times 1000 \times 8.26}=2118[\mathrm{~A}]
$$

* Breaking capacity of breaker [MVA]

MVA $=\sqrt{3}$ short-circuit current [kA] line to line voltage[kV]
(3) Short-circuit current at point C : Isc a) Impedance Map

* Parallel sum of impedance

$$
Z=\frac{1}{\frac{1}{33.26}+\frac{1}{2001}+\frac{1}{8001}}=32.58[\%]
$$

b) Short-circuit current Isc

$$
\mathrm{Isc}=\frac{1000[\mathrm{kVA}] \times 1000 \times 100}{\sqrt{3} \times 220[\mathrm{~V}] \times 32.58[\%]}=8055[\mathrm{~A}]
$$

## Calculation formula

Rated current In $=\frac{\text { Transformer capacity }}{\sqrt{3} \times \text { Rated voltage }}$
Short-circuit current Is $=\frac{\text { Transformer capacity } \times 100}{\sqrt{3} \times \text { Rated voltage } \times \% \text { Z }}$

## Technical information

## How to calculate short-circuit current value Combination of transformer and impedance

<Table. 3> Combination of transformer and impedance

| Transformer | 3 phases transformer |  |  |  |  |  |  |  |  |  |  |  |

## Technical information

## How to calculate short-circuit current value Calculation example

Using a certain graph, you can find and calculate the short-circuit current value which is at one position of network. No matter the condition of network is different, you can do the calculation through adjusting variables.

## Graph note

P coordinates - Transformer capacity (kVA)
Is, coordinates - Short-circuit current value (kA)
Is ${ }_{2}$ coordinates - Short-circuit current value affected cable condition (kA)
(a) Line - \% impedance of transformer (\%)
(b) Line - Length of cable ( m )
(C) Line - Square mm of cable $\left(\mathrm{mm}^{2}\right)$
(d) Line - Is 2 (kA)

Remark) © line shows the length of hard vinyl cable (600V IV)

## How to calculate short-circuit current value

(1) 3 phases transformer
(1) Short-circuit current value at (A) where it is just below transformer. At P coordinates, find the coordinates value (g) of the cross point (f) which is from transformer capacity (e) and A line. Disregard primary part impedance of transformer.
(2) Find the short-circuit current value at Point B, C which are considered cable impedance.

- At short-circuit current g (kA) of Is coordinates, find the value (h) of $B$ line
- Move (h) to parallel direction of Is, and find the cross point (i) to C line.
- Move (i) to parallel direction of Is 2 , and find the cross point value (j) to $D$ line ( $g$ ), finally find (k) of IS2
(2) 1 phase transformer
(1) Short-circuit current value where it is just below transformer. Find the value as same as that of 3 phase transformer and multiply it 3 times. ( $g^{\prime} k A$ )
(2) Find the short-circuit current value where it is considered cable impedance.
- Multiply $2 / 3$ times to $g$ ' of Is coordinates
- Find the $I s_{2}$ value as same as that of 3 phase transformer and multiply it $3 / 2$ times.

## Remark

1. It's not considered the transformer contribution. Multiply 4 times the rated current of transformer in cases.
2. The real short-circuit current value is littler lower that its calculated value by the way we suggest because we take the rated voltage as AC200V, 400 V . So the current value should be calculated in the consideration of stability
3. The calculated value is symmetrical real value.

## Technical information

## How to calculate short-circuit current value Calculation graph

(1) Short-circuit current value at point A (IsA)

- At P coordinates, find (f) which is the point which is to match transformer capacity 500 kVA and A line. Then move (f) to Is $\mathrm{s}_{1}$
(2) Short-circuit current value at point $B$ (lsb)
- Find value $h$ of $B$ line ( 20 mm ) at $g$ ( $=$ 29 kA ) of $\mathrm{Is}_{1}$ coordinates
- Move h parallely to the direction of Is ${ }_{1}$, and find value I at the cross point with C line (200mm)
direction and finally find (g).
- $I_{s a}=29 \mathrm{kVA}$ (g)
- Move I parallely to the direction of $\mathrm{Is}_{2}$, and find value $j$ at the cross point with $D$ line ( $\mathrm{g}=29 \mathrm{kA}$ )
- $\mathrm{I}_{\mathrm{ss}}=19 \mathrm{kA}(\mathrm{k})$

# Technical information 

## Susol

## (3) Short-circuit current value at point C (lsc)

- Find Is coordinates value ( 19 kA ) of short-circuit current value $k(=19 \mathrm{kA}$ ) at Point B. and find cross point $m$ between 19kA and $B$ line.
- Move $m$ parallely to the direction of $\mathrm{Is}_{1}$ coordinates, and find the cross point n at C line ( 30 mm ).
- Move $n$ parallely to the direction of $I s_{1}$ and find the cross point $p$ of $I s_{2}$ with $D$ line.
- $\mathrm{Isc}=10 \mathrm{kA}$ (g)

## Installation instruction

## Susol

## Frames 15A to 125A front mounting type circuit breakers and molded case switches.

## $\triangle$ DANGER

## Hazard of electric shock, burn or explosion

1) This equipment must be installed and serviced only by qualified electrical personnel.
2) Turn off and lock out all power supplying this equipment before working on or inside equipment.
3) Replace all devices, doors, and covers before turning on power to this equipment.
4) Always verify that no voltage is present before working on or inside equipment, and always follow generally accepted safety procedures.
Failure to follow these instructions will result in death or severe injury.
LS Industrial Systems is not liable for the misapplication or mis-installation of its products.

The user is cautioned to observe all recommendations, warnings and cautions relating to the safety of personal and equipment as well as general and local health and safety laws, codes and procedures.

## 1. Circuit breaker installation

Make sure that the equipment is suitable for the installation by comparing nameplate ratings with system requirements. Inspect the equipment for completeness and check for any damage.

## $\triangle$ DANGER

## Hazard of electric shock, burn or explosion

1) Before mounting the circuit breaker in an electrical system, make sure there is no voltage present where work is to be performed.
2) Mount no closer to enclosure metal or live parts than is indicated in drawing.
3) All enclosure closing hardware must be installed.

Failure to follow these instructions will result in death or severe injury.
Dimensions for electrical and mechanical clearance to metal or live electrical parts. (See Fig. 1)

## To mount the circuit breaker perform the following steps:

1) For individual surface mounting, drill and tap mounting bolts holes according to the drilling plan shown in Fig. 2. For dead front cover applications, cut out cover to correct escutcheon dimensions refer to Fig. 3.
2) If circuit breaker includes factory- or field-installed internal accessories, make sure that accessory wiring can be reached when the circuit breaker is mounted.
3) Position circuit breaker on mounting surface.
4) Install circuit breaker mounting screws. Tighten hardware securely, but do not exceed 17 pound-inches(2N.m.)

<Fig. 2> Circuit breaker mounting bolt drilling plan
<Fig. 3> Circuit breaker escutcheon dimensions

## 2. Manual operation

Manual Operation of the circuit breaker is controlled by the circuit breaker handle and the PUSH TO TRIP button. The circuit breaker has three positions, two of which are shown on the cover with raised lettering to indicate ON and OFF. The third position indicates a TRIP position and is between the ON and OFF positions. (See Fig. 4)

## Circuit Breaker Reset

After an automatic or accessory initiated trip, or a manual PUSH TO TRIP operation, the circuit breaker is reset by moving the circuit breaker handle to the reset position.
NOTE) In the event of a thermal trip, the circuit breaker cannot be reset until the thermal element in the trip unit cools.

## PUSH TO TRIP button

The PUSH TO TRIP button checks the tripping function and is used to manually exercise the operating mechanism.
NOTE) Press PUSH TO TRIP button once a year to exercise circuit breaker.

<Fig. 4> Circuit Breaker Manual Controls

## Installation instruction

## Susol

## 3. Wire installation-all circuit breakers

See circuit breaker nameplate label or optional lug instructions for wire size and torque.

## $\triangle$ CAUTION

## Hazard of false torque indication

1) Each terminal connectors or conductors should be connected as shown in the Fig. 5.
2) Do not allow conductor strands to interfere with threads of wire binding screw.
3) When installing two cables into a lug body make sure cables do not back out during tightening of the wire binding screw.
Failure to follow these instructions will result in equipment damage.

## 4. Circuit breaker removal

1) Turn off all power supplying this equipment before working on or inside equipment.
2) Remove circuit breaker in reverse order of installation.

## 5. Accessories install(if required)

1) Turn off all power supplying this equipment before working on or inside equipment.
2) Loosen four screws from the auxiliary cover and open it.
3) Install field-installable accessories according to instructions supplied with them.
4) Close the auxiliary cover and secure with screws.
5) If circuit breaker has factory-installed accessories, refer to label on circuit breaker for electrical specifications and lead colors.

## 6. Other safety instructions

Check area where circuit breaker is installed for any safety hazards including personal safety and fire hazards. Exposure to certain types of chemicals can cause deterioration of electrical connections.

## $\triangle$ CAUTION

## Hazard of equipment damage

1) No circuit breaker should be reclosed until the cause of trip is known and the situation rectified.
2) Be careful not to be damaged by accidents during transportation or installation.
3) Check periodically terminals and connectors for looseness or signs of overheating.

## Failure to follow these instructions will result in

 equipment damage.If any questions arise, contact LS Industrial systems Co.,Ltd or refer to the catalogue for further information or instructions.

3) Install field-installable accessories according to instructions supplied with them.
4) Close the auxiliary cover and secure with screws.
5) If circuit breaker has factory-installed accessories, refer to label on circuit breaker for electrical specifications and lead colors.

## 6. Other safety instructions

Check area where circuit breaker is installed for any safety hazards including personal safety and fire hazards. Exposure to certain types of chemicals can cause deterioration of electrical connections.

## $\triangle$ CAUTION

## Hazard of equipment damage

1) No circuit breaker should be reclosed until the cause of trip is known and the situation rectified.
2) Be careful not to be damaged by accidents during transportation or installation.
3) Check periodically terminals and connectors for looseness or signs of overheating.

## Failure to follow these instructions will result in

 equipment damage.If any questions arise, contact LS Industrial systems Co.,Ltd or refer to the catalogue for further information or instructions.

## A-5. Mounting \& Connection

Fixed mounting ..... A-5-1
Connecting terminal \& conductor ..... A-5-1

## Mounting \& Connection

## Susol

## Fixed mounting

Susol TD and TS circuit-breakers can be directly connected to the mounting plate. If busbars or terminals are used to connect the
circuit breaker on the back of the mounting plate, the appropriate safety clearances must be observed.
