

GRIP STRIP

The Choice of Professionals

For several years, chinking applicators have had a choice of a variety of backing materials, but most of these materials sacrificed one important property or another. Triangular and round-shaped rods often had to be cut to insure proper fit and spray adhesive or staples would be added for retention within the chink joint. Finally, a product is available that allows the applicator to bypass these time-consuming procedures. **GRIP-STRIP**, a chemically inert foam backing rod, performs in applications where others fail.

DESIGN

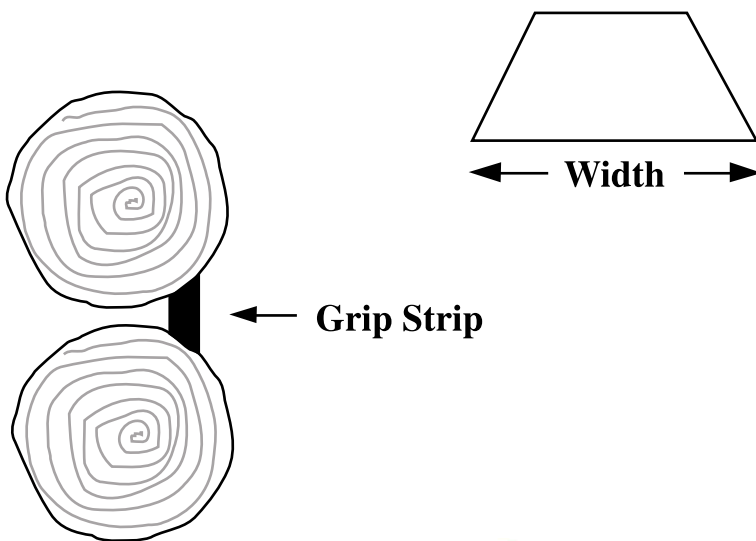

GRIP-STRIP's unique design provides an excellent fit and a flat surface within the chink joint. This results in a savings in material used.

GRIP-STRIP is a closed-cell product. Under normal use, it will not cause outgassing.

ADVANTAGES

- Repels moisture - most open-cell products absorb
- Provides a firm chinking surface
- Compatible with all commercially available chinking
- Compresses to fit a wide variety of log surfaces
- Can be used on exterior or interior surfaces
