

## Monzatech, motorsport engineering

### MWP300

Monza Tech is a **young mechatronics company born from the passion for the racing world to develop innovative projects in motorsports** based in Italy.

In the coming weeks, we shall introduce our first product, **a solution to increase engine efficiency, whether for endothermic i.e. traditional or electric units.** After a development phase extending well over a year, the MWP project yields its first results: an **electronically-controlled, cooling circuit pump capable of autonomously managing engine heating, maintaining the user-defined target temperature, and the cooling cycle.**

This significantly **improves the engine performance and durability.**

**The product is intended for use on karts, cars and motorcycles.**

The company's dynamic approach has led to the filing of further patents covering the kart, motorbike, and car markets.

**Monza Tech stands apart from other companies in that it oversees the entire product chain, from idea to commercialisation, internally engineering all steps.**

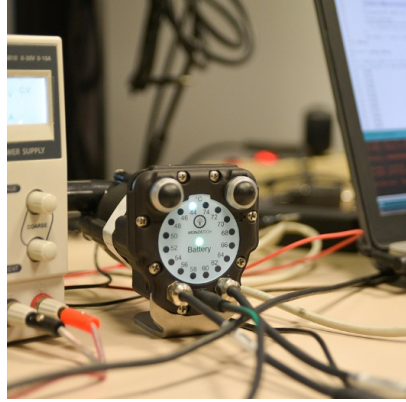

In its corporate mission, Monza Tech relies on technology to **improve vehicle efficiency, never compromising on product quality**, whilst placing a relentless and detailed focus on materials, forms and electronics to deliver true innovation.

### MWP300 Complete set

The MWP300 is supplied with all harness and supports to connect it to the standard cooling circuit.

### Sviluppo prodotto

The management of the prototyping process and assembly development is managed in complete autonomy in our headquarter in Monza
