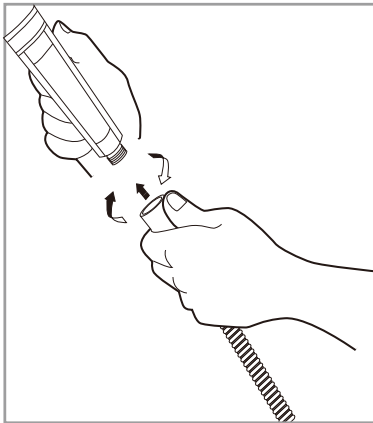

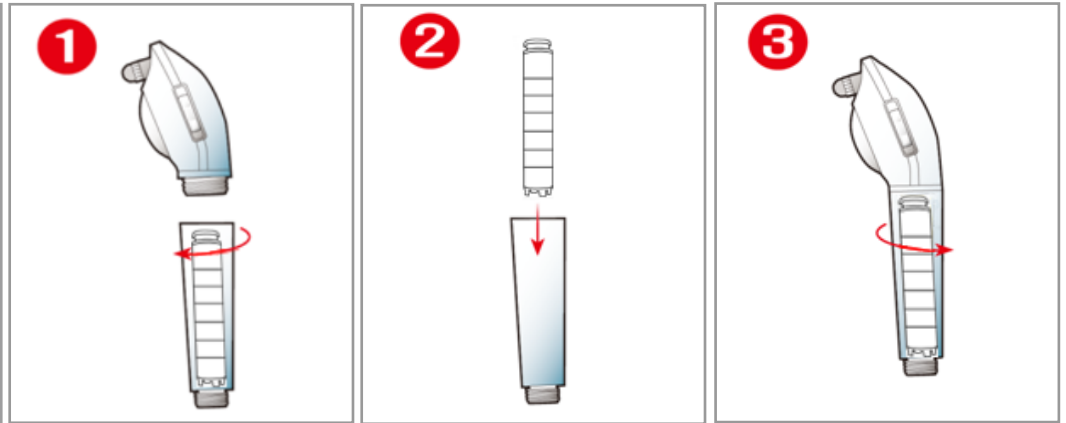

Fig. 2

**Attention:** Check the right direction to insert before loading the filter.

### Note

The filter will accumulate foreign matters or pollutants from water. This is a natural to filter out impurities so there might be contamination on the filter surface. However, even if it looks clean by the naked eye, it must be replaced after six months.

If the water pressure drops significantly, even though it is invisible to the eye, the contaminants are accumulated in the filter. Therefore you will need to replace the filter. And when the colors change severely, it is necessary to change it to use clean water.
