

TPC inc Second Hand Turbochargers

Turbochargers are designed to have a very long service life and some turbos are removed from vehicles still in great condition for various reasons and end up with us. Although many suffer catastrophic failures we always have good cores in stock that could see longer service life without needing an immediate rebuild. These units can be reused for customers seeking a cost-effective transplant to replace their blown turbocharger.

We **Guarantee** that all our used turbocharger come **free of any major defects** rendering the turbo not performing like it's intended use. We internally inspect the turbine and compressor wheels with specialty cameras to ensure no damages are present and no oil contamination exists. We perform a variety of tests to ensure the shaft play is acceptable and that mechanical actuators are performing as intended. We ensure no visible cracks, stripped or broken studs are present.

Although we perform various test to ensure turbo will function properly there is **No warranty** on life remaining of the overall unit. **No warranty** on rotating parts, seals, actuators, oil lines, coolant lines, fittings, housings, solenoids etc. Any attached lines or electronic solenoids attached is to be considered an extra and not included in the price of the used turbocharger. If attached lines or parts are damaged you may transfer the parts from your current turbo to your new second hand turbo to make it usable for service.

Each type of turbo has their common issues and our trained staff will make sure they are not present. Take the guessing game out of buying a used turbo on local listings and buy from the pros. We will help you eliminate the chance of you buying another turbo with a different set of problems.
