Congratulations on the purchase of your new shower system. This guide will give you the instructions on the installation of your new shower.

Natural Travertine Stone Appearance

All of our stone products are custom made and hand-crafted to look and feel like authentic travertine. As you may know, travertine is a form of limestone that has been under pressure for thousands of years. The product of long-ago hot and cold springs and waterfalls, travertine is a beautifully banded and colored stone with a unique character. Among its most appealing characteristics are the interesting craters and depressions, created by streams of water that flowed through the stone. We have taken great care in reproducing the appearance of genuine travertine stone, giving you a beautiful and authentic shower.

Installation time may vary depending on your experience, complexity of shower, and “Pre Installation Preparation Work” which may include: plumbing relocation, drain location and bathroom demolition.

Prior to demolition, scheduling a contractor or building your shower, double check that you have all the parts from the factory. Some applications may require a licensed plumber or contractor. Do not use any product spec sheets to begin installation before receiving product. These spec sheets are for reference only. Use actual product measurements only. The diagrams throughout this guide illustrate a 36” x 36” shower. Depending on the size of the shower purchased, actual parts may vary in size from the diagrams shown.

Our goal is to help you achieve a quick and successful shower installation.

See the clock in each section for estimated installation time.

Missing or damaged hardware and tiles should be reported within 24 hours of receiving this shipment - If you need assistance call 1.800.454.2284, 7:15am - 4:00pm, Monday thru Friday (PST)
1

CHECK YOUR SHIPMENT AGAINST APPROPRIATE PACKING LIST
Make sure you have received all the items necessary for the installation. This will also familiarize you with all the parts and hardware you will need to install your shower. Package contents are dependent upon which package you ordered.

SISTINE STONE PAN SET
- P Metal Leak-Free Reinforced Pan
- TD Threshold for Door (Reversible)
- TP Channel Threshold for Glass Panel (Reversible)

SISTINE STONE WALL PANELS
- WT1 Back Wall Panel Top & Bottom
- WT2 Left Wall Panel Top & Bottom
- WT3 Right Wall Panels Top & Bottom
- L2 Mosaic or Stone Liner Back
- L1 L3 Mosaic or Stone Liners Right & Left Side
- CD Side Casing for Glass Door (3) & Cap
- CP Side Casing for Glass Panel (3) & Cap

HINGED GLASS DOOR SET
- GD Glass Door (Reversible)
- GP Fixed Glass Panel (Reversible)
- DH Door Handle
- GH Hinges Top & Bottom (Installed)
- HB Top Hinge Wall Bracket
- DB Door Bottom Sweep
- GS Door Seal/ Stop
- DA Drain Assembly (may be sold separately)
This shower system is designed to be installed on a bare floor. It is necessary for any existing shower to be completely removed. Tear out and remove all old material to expose the 2 x 4 wall studs. Clean up the shower area, removing all dust and old material from the area.

It is easier to check alignment of studs and pan without the drain installed into the pan. Place the pan in the planned position. Check to see that the spacing between the metal pan flange and 2 x 4 studs are flush. Some shimming or sanding of the 2 x 4 studs may be required to flush the studs with the metal pan flange. When screwing in the 1/2" cement board the metal flange will pull fast to the studs, and will secure the metal pan in place. (diagram 1)
Using the pan and wall panels, you will be able to check to make sure your 2 x 4 studs are in the needed position and supported adequately. You will see in (diagram 2) extra 2 x 4 studs are added to the door and glass side thresholds for extra strength. You may need to make adjustments for your faucet or optional shampoo shelf. When you place the bottom sections of the wall into the shower pan, you can also calculate the needed width and height of areas to keep free of 2 x 4 studs. (See installation instructions included with the faucet or shampoo shelf)

1. Locate the drain assembly to install into pan.
2. Apply a generous bead of 100% RTV silicone around the shower pan drain hole and around the outside of the drain collar #5, insert the drain collar #5 into the drain hole.
3. Apply a generous bead of 100% RTV silicone around the drain collar #5 from the underside of the pan.
4. Install the rubber gasket #6 over the drain collar #5, to the underside of the pan, next install the slide ring #7.
5. Screw on the drain lock nut #8 and hand tighten. Turn drain lock nut #8 approximately 1/4 turn with the wrench to ensure a water-tight fit. Check for a good seal. DO NOT OVERTIGHTEN.
6. Wipe off excess 100% RTV silicone and allow to dry. Follow the manufacturer’s directions for application and drying time.
CEMENT BOARD INSTALLATION

TIME REQUIRED 1-2 HRS

We recommend the use of 1/2" thick cement board as your shower backer. This is a common backer for stone and tile. Using this backer will help comply with almost all city codes. A cement-based product like Wonderboard or Hardibacker may also be used if it meets your local codes. Some codes require a vapor barrier to be installed as well. We recommend a water/vapor barrier of 6 mil. plastic be installed before installing the cement board. To do this, staple plastic so that it hangs 1" above the floor. Roofing nails may be used to attach the cement board instead of screws, this prevents the plastic from wrapping around the screws.

1. IMPORTANT: Use your cement board as an indicator of squareness. The cement board comes in square sheets. If you see gaps or areas where the cement board is not fitting flush, fix the problem by removing the cement board and shimming the board until it’s square and flush. If the seams of the cement board are not flush and square, your wall panels will not be square and flush.

2. Cut a notch in cement board to fit around threshold. Sanding or shimmimg the 2 x 4’s at the top rim of the pan may be required to flush the cement board. (diagram 5)

3. Place a bead of 100% RTV silicone on the front INSIDE face of the shower pan flange. The bead should be in a zig-zag pattern.

4. Place the cement board against the studs and rest it inside the shower pan against the back flange. Attach the cement board to the studs with screws or nails. Do not screw or nail into the shower pan flange.

5. Continue installing the remaining cement boards.
**A - Pan Threshold**

1. Locate the threshold pieces (diagram 6) (diagram 7).
2. Dry fit thresholds onto the front of the metal pan. The Door threshold does not have a channel in it. The door rail is reversible and can be placed on the left or right. (diagram 8)
3. Remove and place 100% RTV silicone in the Pan where the bottom of thresholds rest, and in the bottom channels under the thresholds, re-install thresholds into pan sitting level.
4. There will be a small gap between the bottom of thresholds and the floor, this can be grouted later if it is still exposed after installing bathroom flooring.

**B - Glass Door and Glass Panel Casing Trim**

1. Locate Glass door side casing.
2. Locate glass panel channel side casing & cap. (diagram 9)
3. To help with the side casing installation, use a level and draw a plumb line from the inside of the pan threshold up to the top of the shower. Do this on both sides. This line will be where the side casings and the wall Panels meet, this will give you a visual reference point when dry-fitting your wall panels.
4. Apply 100% RTV silicone, using a circular pattern, to the cement board along the plumb line, approximately 4 inches wide, to the edge of the shower pan. (diagram 10)
5. Place the first side Casing into position, making sure to align the side rail with the vertical plumb line previously drawn on the cement board. Apply pressure to the side casing to bond it to the cement board. The side casing will be flush with the inside of the shower pan threshold and have a small gap where the pan threshold slopes. (diagram 11)
6. Place the remaining side casings into position, 3 to each side and cap. Make sure to use a level and the plumb line previously drawn on the cement board to align the side casings vertically.
WALL PANEL/LINER INSTALLATION

**TIME REQUIRED**
3-4 HR

**A - Inspecting Wall Panels/Liners**
Inspecting panels at this point will give you confidence that the wall panels are straight and square from the factory. When installing wall panels, you may need to make adjustments to the panels to accommodate for unevenness of your existing walls. During the inspection process and/or dry-fitting process, if you have any concerns about the alignment or fit of the wall panels, please call 1-800-454-2284 for customer service, and we will gladly assist you with your installation.

1. Find a large empty area to layout and inspect all panels.
2. Align all panels and liners to check for straightness. Make sure grout lines are straight and square to each other.
3. Sistine Stone wall panels are made to be flexible and may have a slight bow. This condition is normal and wall panels will flatten out when properly installed. If wall panels have been stored improperly or have become excessively bowed, they can be easily flattened before installation (See trouble shooting section on last page for details).

**B - Dry-fit Wall Panels/Liners**

1. Place your first bottom back panel (WB) into position. (diagram 12). Rest WB panel onto the pan floor; use spacers between the floor and the panel to make the top of the panel level.
2. Place the back liner (L1) into position. Make sure the grout lines are aligned, use spacers to make the top level. Inspect the spacing between the wall panels and the side threshold plumb line.
3. Place the top panel (WT) into position, push the two panels together. Make sure the grout lines are aligned, use spacers to make the top of the panel level. Inspect the spacing between the wall panels and the side threshold plumb line.
4. Depending on your cement board alignment, some sanding of the wall panel edges may be required for a tight fit.
5. Holding the upper panels and liner in place with another persons help, check the length and overlap alignment. Some fitting may be required.
6. Place one of the bottom side panels (WB) in position check for level and length.
7. Place the side liner (L2) into position. (diagram 13)
8. Place one of the top side panels (WB) into position.
9. Repeat steps 6 through 8 for other side of shower
10. Depending on your faucet selection, you may need to mark and cut out holes for your faucet to fit through before you can place the panel into position. Remember “measure twice, cut once”, you can cut our walls with most cutting tools.

(See installation video at www.americانبathfactory.com). Now you can check for levelness and grout line alignment and spacing between walls and plumb line.
WALL PANEL/LINER INSTALLATION (continued)

C - Installing Panels

9. Remove all dust and dirt with a clean dry cloth. This will increase the bond to the 100% RTV silicone.

10. Start with the bottom panel. Apply a generous amount of 100% RTV silicone to the cement board and to the back side of the wall panel. Also refer to the manufacturer’s recommendations for application and drying time.

Braces may be required to keep walls flush

11. Press the wall firmly into position. Be sure to use spacers between the bottom panel and the shower pan to ensure panel is level. (diagram 17)

12. Install the panels in the same order as you dry-fitted the panels.

OPTIONAL SHAMPOO SHELF INSTALLATION

1. The Shampoo Shelf was designed to match your tile size. (2) 12” x 24” tiles, the cut-out hole size is 10 x 22”.

2. There is a 1” lip or frame around the Shampoo Shelf, this will be the water sealed area for the Shampoo Shelf.

3. The best way to cut the hole is with a small 5” round diamond blade, and with a jigsaw to cut the corners.

See detailed instructions enclosed with Shampoo Shelf

4. On the 2 tiles the Shampoo Shelf will be replacing, mark 1” from the outside of the grout line, the cut-out area will be 10” x 22”. Cut out the hole for the Shelf. The smaller the hole the better.

5. Dry-fit the Shampoo Shelf for alignment of grout lines.

6. Using 100% RTV Silicone in-place with a generous bead around the back of the lip, wipe off excess silicone with tissue.
A - Handle Installation

1. Set the glass door in a position to enable the assembly of the handle. (diagram 18)

2. Loosen the set screws so you can separate the handles.

3. Unscrew the long bolt from the handle. Keep all rubber pieces attached to the screw.

4. Remove the first set of flat, clear washers from the bolt.

5. Start with the top hole on the glass door. Place the long bolt through the hole in the door (keeping the remaining rubber pieces on the bolt). On the other side of the glass place the flat washers onto the threaded portion of the bolt. (diagram 18)

6. Take one side of the handle and screw the long bolt into the end. Just start the bolt until a few threads catch. Keep loose.

7. Put the second bolt through the lower hole. Place the flat washer onto the bolt. Screw the bolt into the bottom handle.

8. Align the handle on the door and carefully tighten the long bolts. Do not over tighten.

9. Place the opposite handle over the long bolts and tighten the set screws to secure the handle.

B - Hinge Installation

1. Locate the top hinge and remove the side plate by loosening the two screws. (diagram 19)

2. Apply a generous amount of Plumber’s Putty onto the hinge and side plate.

3. Position the hinge onto the glass door lining up the holes so that the screws are on the outside of the shower door. This will ensure a better water tight seal.

4. Attach the side plate with Plumber’s Putty applied to the glass and tighten the screws until the hinge is secure. Wipe off the excess putty and allow to dry.

5. Repeat these steps for the bottom hinge.

C - Dry-fit Fixed Glass Panel & Glass Door

1. Gently insert the side glass panel into the channels. You will be adjusting the fixed glass panel so it is level with door and has an even 1/4” gap between the door and the fixed glass panel. Use rubber setting block to adjust height and level if necessary.

2. Next, to determine the position of the bottom hinge pin hole, place the top hinge pin bracket upside down on bottom pan threshold as a template. (diagram 20) Align bracket hole to center of side glass panel. Mark the hole and remove the bracket. Carefully drill 1/4” dia hole for hinge pin approximately 1 1/4” deep into the pan threshold.

3. Pick up the door you have installed the hinges and handle onto, and gently place the bottom hinge pin into the 1/4” hole you have drilled into the pan threshold (making sure you have the teflon slide washer on the pin).
**D - Install Fixed Glass Panel & Glass Door**

1. With someone helping to hold the shower door, place the top hinge mounting bracket (diagram 19) over the top hinge pin (making sure you have the teflon slide washer on the pin). Check to make sure door is vertically level, then mark with a pencil through the 3 holes on top hinge mounting bracket. Move door and top hinge mount to one side and pre-drill the holes into the studs. The drilled holes should be large enough so the screws don’t bind in the stone. Insert and tighten screws. After dry-fitting the fixed panel into the correct alignment, remove the glass, and place a 1/4” 100% RTV silicone bead into the channels. Re-insert the fixed glass panel and check alignment again. Let dry.

We have provided door seals for water sensitive areas such as wood floors. If glass panels and door are installed correctly with the proper spacing, outside water spillage will be minimal and the side seals won’t be necessary. **The door sweep is what keeps the door closed.** Adjust the door seal until the required tension is achieved. The door sweep has been cut to fit over the hinge. Cut off the excess length opposite of hinge side.

If you would like to use these side seals, follow the steps below.

2. The L shaped seal goes along the hinge side of the door on the threshold trim pieces. (diagram 21)
3. Place the seal along the edge of the glass and cut the seal to the proper length.
4. Remove the backer from the seal exposing the 2 sided tape, only remove a small amount at a time.
5. Starting from the top, align the seal along the edge of the door and stick the seal to the threshold.
6. Work your way down the door. Do small sections at a time, slowly peeling the backer off the seal.
7. Locate the plastic h shaped seal (diagram 22). It goes on the fixed glass, next to the handle edge. Measure and cut the seal to length.
8. Starting from the top, push the seal onto the glass panel, slowly working your way down.
SHOWER SYSTEM TROUBLESHOOTING

Correcting Bowed Wall Panels  Sistine Stone Wall Panels are made to be flexible and may have a slight bow. This condition is normal and the panels will flatten when properly installed. If the panels have been stored improperly or have become excessively bowed, follow instructions below. Using a heat gun or propane torch, heat the backside of the panel in the most bowed area. Hold the torch a few inches away and move the torch back and forth over the area. After the panel becomes malleable, lay panel on a flat surface and apply weight until cool and flat. (Wall thresholds work well, refer to Installation Guide Packing List).

Cracked Tile  As with any tile project, a tile can become damaged. Simply cut out the damaged tile, silicone a replacement tile in place, and grout.

Cracked Wall Panel Seam  If your wall panel develops a crack in a grout line, simply grout over the cracked seam when it is installed. The grout will correct the problem, you will not be able to tell the crack was ever there.

Scratches & Blemishes  Can be removed by wet-sanding the tile surface. Make sure tile surface and sandpaper are wet, and sand tiles until scratches and blemishes are removed.
