

2021 F150 ACCENT LIGHTING

STEP 1

Use a pry tool to pry the trim piece open to allow the light wire from the kit to be inserted in the gap. We recommend starting at the top and working your way back to the center console.

Light strip

STEP 2

Once the entire strip is ran to the center console use a pry tool to lift up on the circled area in the photo below and run the light strip under this piece and into the center console.

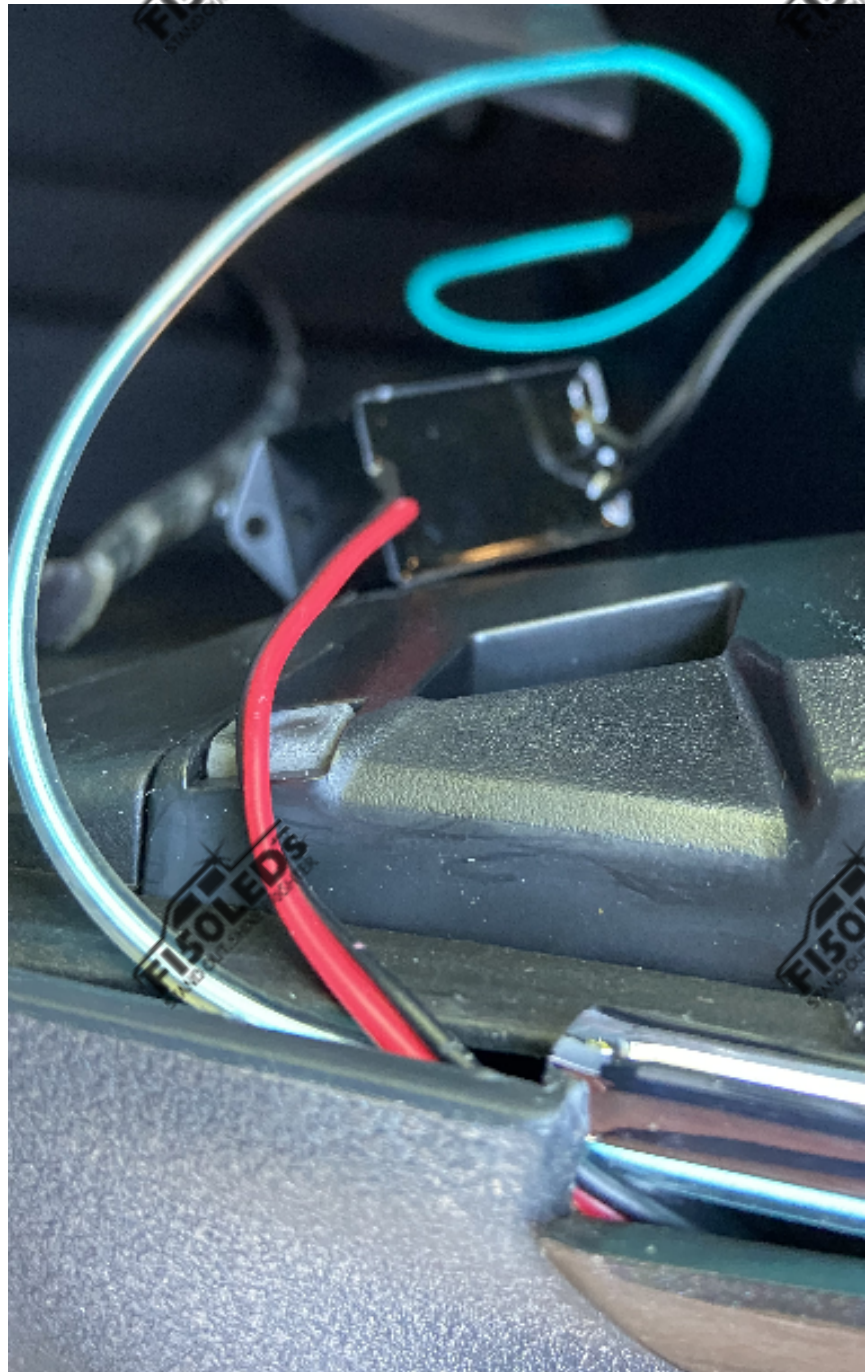

STEP 3

Repeat these steps on the other side.

STEP 4

Use a pry tool to pry up the end of the trim piece in the center console on the passenger side to allow the wires from the power source to run under it and place the small black box in the wiring in the center console.

STEP 5

Run the power and ground wire under the trim piece so it can be tucked down into the plastic trim piece by the passenger foot well.

STEP 6

Use a pry tool to pull the plastic trim piece back to slide the power and ground wire behind it.

Once you have done this the wire should run across the trim piece and out of the bottom of the trim piece.

STEP 7

Run the wire across the front of the passenger foot well so that the wire is not seen. Then ground your terminal ring to the bolt at the front of your passenger foot area using a size 10mm wrench.

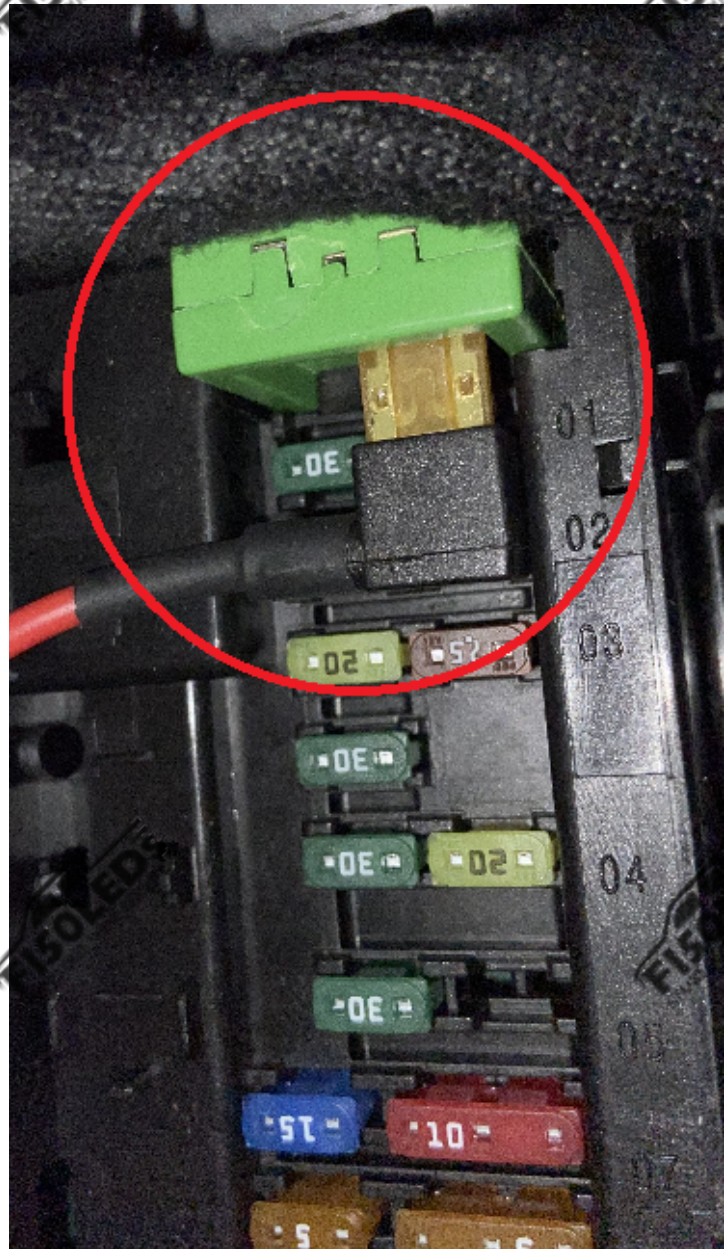

STEP 8

Remove the plastic piece that is covering your fuse panel, remove the fuse that is inserted in fuse location 2 and insert it into the bottom of the fuse tap that comes with the kit.

Then insert your fuse tap into fuse location 2. You may need to wiggle the fuse tap under the green fuse above the fuse tap.
