

HOW MUCH COFFEE DO YOU CONSUME?

A Coffee Arabica bush yields 1-1.5 lbs of green coffee per year.

This amount will shrink to about .8-1.2 lbs of useable coffee, having lost 20% of its weight in moisture during the roasting process.

While it takes up to **five years** to mature, it can yield fruit for up to **sixty years**.

The average American coffee drinker drinks three 9oz cups a day. Over the course of a year, that's enough to fill over **nine** 1lb bags of coffee beans.

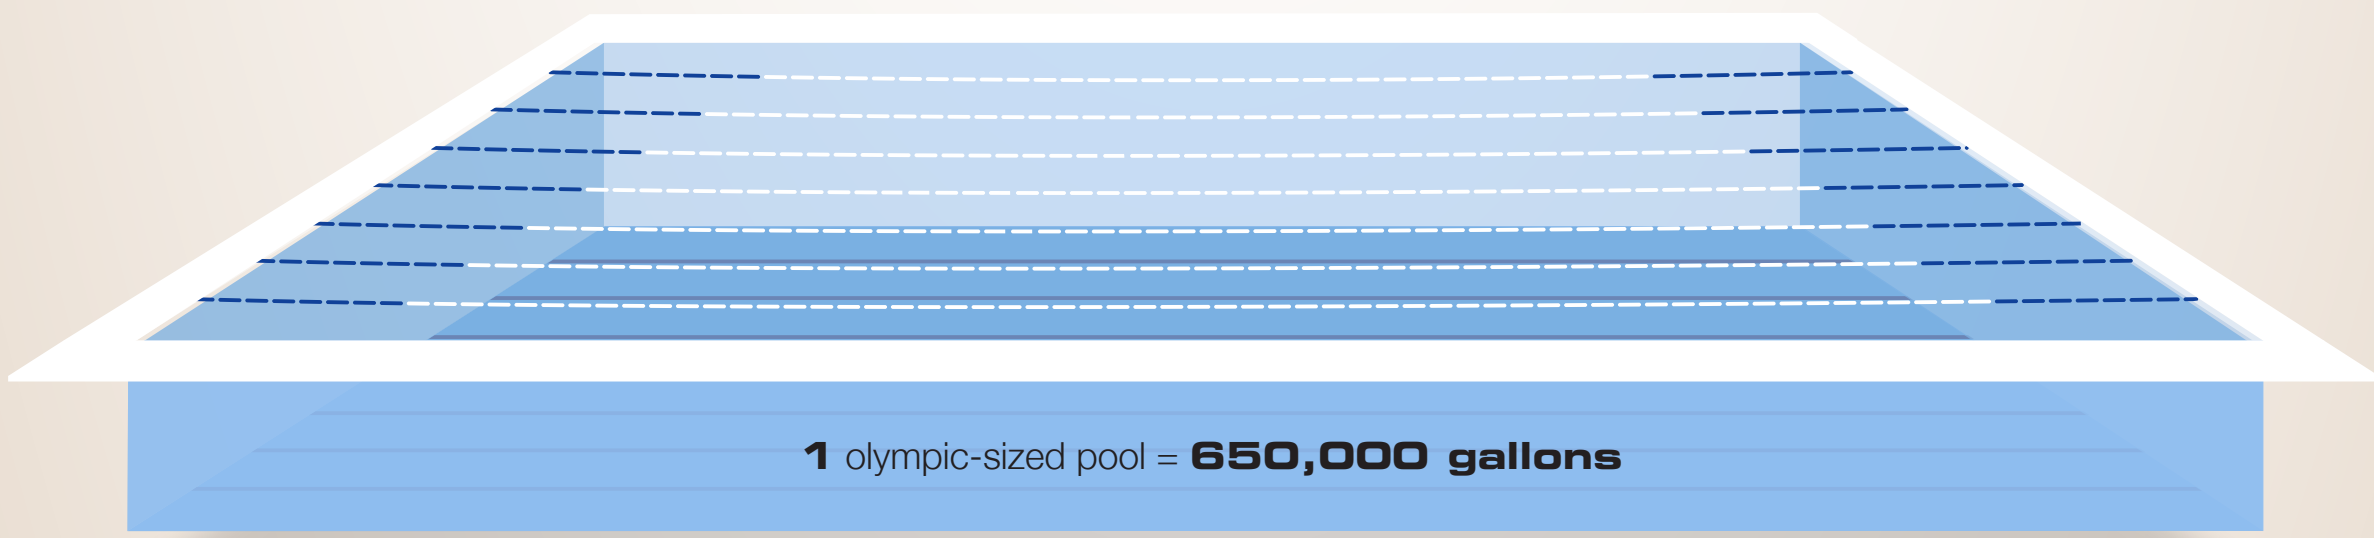

Since one pound of beans is roughly the useable amount of beans from a single tree's harvest, that means the same amount of a tree's yield as bags will be consumed by the average American coffee drinker in one year.

The majority (**54%**) of adult Americans drink coffee. Specifically, that's 127,135,186 out of 235,435,530 American adults.

When totalled up, the amount of coffee consumed every day by American adults is about **343,850,000 oz**, or **2,686,000 gallons**.

That's enough to fill **four** olympic-sized pools!

Every year, the amount of coffee consumed by American adults would be enough to fill one of these pools over

1,500 times

So how much coffee do **you** consume?
