

TRITON PFD - fits LSC TRI-SAR and TRITON Harness

The Triton PFD is designed for still, flood and swift water rescue where the rescuer could encounter hazards that require an inherently buoyant PFD.

Helicopter and water rescue teams who need inherent floatation and vertical lift or over-the-bank capability have been putting PFD's over the top of Triton/Tri SAR. This has resulted in less than ideal floatation and fit. The TRITON PFD solves that issue by attaching to LSC harness with no modifications necessary, utilizing LSC standard mounting systems for Triton/TriSAR vests

In addition to the LSC standard mounts, the Triton PFD has user defined restraint system that secures the PFD to the harness waist belt. This assist with keeping the PFD secure and in place. The front and rear Molle allows the user to have a variety of configurations depending on their environment.

Features:

- Removable sealed foam (an industry first) allowing for decontamination.
- Triton PFD can be used without the flotation system.
- Heavy-duty Laser-cut molle front and back with 1050 denier fabric
- Velcro T-tabs for excess webbing management
- Shaped PVC foam, and deep cut armholes for unrestricted rescue swimming
- Size: Universal one size fits most: (Chest) 30" - 54" 76cm - 137cm
- Approx 20 lbs, 9 kg, 90 N of flotation - designed to reduce the impact for over-water helicopter emergencies.

TRITON PFD

ACCESSORIES: additional flotation, hydration, ballistics protection systems, extrication leash, and back pocket

Triton Vest - fits LSC TRI-SAR and TRITON Harness

The Triton MOLLE vest allows the user to configure both the LSC Triton and TriSAR harness for helicopter search and rescue activities where the LSC inflatable vest or swift water/flood floatation (Triton PFD) is not indicated.

The Triton Vest provides additional MOLLE space for user-defined pouches, radio holsters etc. There are two vest options for the user to choose from. Laser-cut MOLLE vest (seen below) and mesh vest with Molle attachments (pictured to right, loaded).
