

Adaptive Arm Pal Block

This is a unique, three-sided, cushioned block that supports the arm or elbow at 5 different heights.

The block rests on the side of the couch next to the patient. The 5 available heights allow the operator to rest their arm or elbow on the block and adapts to the different sizes of patient and for different procedures.

This simple, ergonomic solution provides muscle recovery opportunities to relieve harmful static-load postures for the operator or other professionals required to hold a fixed position during their work.

A popular aid for ultrasound departments.
