

How to mount the front light (repeat steps for the rear light and the seat stay)

1. Remove the magnets from the packaging by using the key to unscrew the bolts. Mount a magnet on one of the spokes on the front wheel. Insert the bolt and tighten using the key. The magnets should be mounted no more than 15 cm below the top of the rim.
2. Locate the mounting guide (coin) and attached it on top of the magnet.
3. Locate the front light by looking for the white marker on the base part. Mount the light onto the fork and insert the loop of the wire into the hook of the base part. Align the circles on the side of the light with the mounting guide and push them close together. Insert the key into the slot on the bottom of the light and turn it several times until the wire is tightened around the fork.
4. Make sure the light is positioned correctly and tighten the wire firmly until the light is firmly secured.
5. Remove the mounting guide and spin the wheel to check that there is no interference. If there is no light right away, please allow the wheel to spin for a while.
