

NOVA Mounting Manual for the Dynamo - English

- 1.** Place the dynamo at the fork/seat stay with the wire around the tube and insert the loop of the wire into the hook of the base part. Make sure the dynamo is aligned with the aluminium rim. Use the included tool to fasten the wire by rotating the tool clockwise.
- 2.** Make sure to place the dynamo as close to the rim as possible without any interference. There should be a maximum of 2 millimeters between the dynamo and the rim. Decreasing the distance will increase performance.
- 3.** Insert the cable in the light as well as in the dynamo. Spin the wheel to check if the light works. If not give the cable an extra push to make sure it is inserted all the way.
