**NOTE:** YOU CAN UPGRADE A GRI-1300 TO A GRI-1350 LI

CALL CARTTEK 541-633-4308
INTRODUCTION

Thank you for purchasing the Cart Tek GRI-1300/1350Li golf caddy. Please read this manual carefully before use. After unpacking please keep the carton and all internal sections in safe storage. In the unlikely possibility that you need to return the whole unit due to a defective component, you will need to repack the unit in the original manner to ensure safe and secure transit. Check that all components are included in the package –

- Main Caddy frame
- Transmitter
- Drive wheels
- Anti-tip wheel
- Battery complete with battery bag and battery cable
- Battery charger
- Accessories
- User Manual
- Tool kit

Contents of this manual cover assembly from the delivery carton – operating instructions – maintenance – and troubleshooting. Please note that our design and manufacturing policy is aimed at continuous improvement, this can result in changes without notice to the specifications contained in our websites and in this manual.
QUICK TIP

After unpacking the caddy and while reading this manual, place the battery on charge while you assemble the unit. Plug battery into charger and charger into power source. The battery may be delivered with a charge but should always be placed on charge before using to ensure full charge of battery.

BASIC SET-UP

• Remove all components from carton. Note any damage with carrier.
• Assemble the two large wheels. Depress button on the inside wheel hub to fully seat wheel onto axle drive collar. The drive collar is fixed on the axel and has four holes that align with four screw heads on the wheel drive hub. Note: Wheels are unidirectional. Button should face towards the back when on top of axle.
• For “free wheel” mode depress and pull wheel out ¼ of an inch, making sure it is engaged and attached to the axel.
• Install rear anti-tip wheel. Under axle, pull out the anti tip wheel lock pin and slide anti tip wheel into frame until locked.
• Lift handle and secure with lower locking knob.
• Extend handle fully and secure in position by lowering the “upper bag rest”, which is already attached to the handle.
• Securely attach antenna to receiver dome on the top of the handle.
• Place battery in tray. Insert battery cable into caddy, making sure to align pins. Depress the silver spring lock before removing cable.
• Load golf bag onto caddy. Balance weight of golf bag equally “side to side”. Attach bag straps using the metal latches; the shorter strap goes on the bottom and longer strap attaches to the underside of the top bag rest. For best results always leave the lower bag strap attached and stretch it out over the bottom of your golf bag.
• Insert two AAA batteries into the remote control. Turn on the remote control. The on off switch is on the backside of the remote control. Notice the antenna on the remote. It is optional to pull out. Pull out if needed for longer range.
• Place the USB cable that comes with your caddy in a secure location. It is only used if you need to “pair” a new remote to your caddy. Your remote is already matched and paired to your caddy.
• Two 40 amp blade fuses are packed with the GRI-1300. Carry these in your golf bag. In case of power loss, check the fuse located on the red wire lead of the battery cable.
PRECAUTIONS

GRI-1300/1350LI Important Customer Care Information

PLEASE READ the entire manual. We’re not kidding!

1) A normal cart bag will result in best caddy performance, where lightweight stand or carry bags may not work well for you. For best performance heavy cart bags are preferred. If you use a carry bag or stand bag you may need to add weight.

2) If you need to add weight, consider adding a water bottle of sand inside a low pouch in your golf bag to increase the weight over the front wheel. Equally distribute the weight, use the center pouch or equal weight added to each side pocket.

3) Consider the all-around weight distribution of your golf bag. Ensure the bag is balanced evenly side-to-side. Uneven weight distribution may lead to “tracking errors” i.e. too
much weight on the right side will cause caddy to veer to the left.

4) The front wheel must stay grounded during play. The only exception is on steep inclines. Your cart should only tip onto the rear wheel when on extreme inclines (Over 25 degree inclines).

5) On steep inclines if the front wheel does come off the ground use manual mode to guide the caddy. Avoid steering the caddy with the remote if the front wheel is off the ground. Using the remote in this situation can lead to gearbox or shear pin failure.

6) **IMPORTANT TIP.** *Do not use the parking brake button when going down steep inclines.* For best control of caddy, use the reverse arrow to decrease speed. If you need to stop your caddy on the incline turn the caddy perpendicular (across) the hill and hit the coast button and then the parking brake button.

7) Periodically spray the front wheel bearings with WD-40.

8) Periodically spray the bearings on the drive wheels between the drive collars and gearboxes with WD-40.

9) Do keep a set of fresh unopened AAA batteries in your golf bag for your remote. Replace remote batteries if you experience missed commands.

10) Always check the bottom-locking knob for tightness before every round of play.
**Battery Maintenance**
The GRI-1350Li Caddy comes with a rechargeable, 24V Lithium Ion 10 Ah battery. The GRI-1300 has a rechargeable, 24Volt-15 amp hour sealed lead acid (SLA) battery.

- When ever possible we ship the batteries with a full charge. Before using your cart for the first time put battery on the charger and charge until the charger LED indicates a full charge.

- Plug battery into charger and then plug charger into power source. Remove charger from power source when not charging the battery.

- Always recharge battery after every use. Never leave the battery in an uncharged state.

- Lithium charger: Verify that the charging LED comes on Orange or Red when plugging into a discharged battery. Following the complete charging cycle, the charge LED is solid green. Normal charge time is 3-5 hours.

- SLA Charger: Verify that the charging LED is red when plugged into a discharged battery. This charging LED turns off when charge is completed. The power LED is red when plugged into the wall with no battery connected and green when a battery is connected. Normal charge time is 6-8 hours.

- Charge your battery following each use. Disconnect the battery once charged. In periods of inactivity charge your lithium battery every 12 weeks and the SLA battery every 6 weeks. Do not leave the charger connected to the
battery for more than an over night charge if it does not complete the charge in that time frame.

• Not charging your battery after 9 holes will not increase the battery life, it will decrease it.

• Store the battery in a cool dark place, off of the ground. It is best to store and charge the battery on a wood surface.

• Do not store or charge the batteries on a concrete surface.

• Regularly inspect the SLA battery cable connections for any corrosion. Remove cable from battery and check both top and bottom surfaces of the ring connectors. Clean with WD40 if necessary. Wipe off excess film and screw battery cable back onto battery.

• Ensure that the SLA cable is not loose on the battery. The ring terminals on the battery cable that connect to the terminals should be screwed in tightly. There should be no movement.

• Always inspect round battery plug. Ensure that the round plug is screwed tightly.
TURNING ON YOUR GRI-1300/1350 LI

Place your battery into the battery tray and plug battery cable into caddy. Always press the silver spring lock on battery cable when inserting and removing battery cable from caddy. If the round plug at the end of the cable becomes loose, retighten.

When first connecting the battery to the caddy, the green LED on the receiver dome will slowly flash. This is “Standby” mode. Push and hold on/off button until the green LED is solid.
Power/standby Indicator LED

Antenna

Speed Dial

On/off button

Receiver Dome on Cart Handle
MANUAL MODE

• Turn speed dial back to zero – counter clockwise.
• Rotate speed dial clockwise to increase the speed of caddy.
• Rotate speed dial counter-clockwise to slow/ stop caddy’s motion.
• In manual mode there are three ways to stop your caddy.
  ✓ Turn the speed dial (left) back to zero.
  ✓ Push the on/off button on the receiver dome once.
  ✓ Push the coast button on the remote control.
• To resume use in manual mode, turn the speed dial back to zero and then turn speed dial clockwise to the desired speed.

REMOTE TRANSMITTER

• The transmitter has a small on/off switch on the backside. To save battery life, turn off the remote control transmitter when not in use.
• Replace AAA batteries as needed.
• If your caddy misses signals replace batteries. Do not use “rechargeable” batteries. They do not have sufficient voltage to send a strong signal.
**Forward:** Moves caddy forward and increases speed with each push.

**Reverse:** When caddy is stopped it moves caddy in reverse. Each additional push increases the speed in reverse. When caddy is moving forward, hitting the reverse slows the caddy down.

**Parking Brake:** The red button in the middle of the directional controls is an electronic parking brake. On inclines park your caddy across / perpendicular to hill.

**Left & Right Arrows:** Turns caddy to the left or right.

**Program/Coast Button:** This button performs two functions. 1) A single quick push allows the caddy to coast to a stop. No brakes are applied, all power to motors is suspended. This is the preferred way to stop your caddy. 2) When caddy is stopped a quick push and hold will move caddy forward and put into program mode. See programing options below.

**Speed Settings:** Preset buttons for specific speeds. 1 is the slowest, 4 is the highest. See programing to change speed settings.
REMOTE CONTROL MODE

• When the green light on the caddy is solid and the caddy is stationary, your caddy is ready for remote control transmission.
• Push the forward or reverse buttons to move the caddy.
• By pressing and holding Left or Right turn, the caddy will turn “upon” itself.
• While caddy is moving forward, a quick push of left or right arrow button will adjust the caddy’s direction.
• To increase the speed. Press forward button. To decrease speed, press the reverse button.
• To stop the caddy on level ground, use the Coast Button.
• To stop the caddy on an incline turn caddy across the hill, hit the coast button and then hit the parking brake.
• The range of the transmitter is 50 – 100 yards depending on environmental conditions. The caddy cart will shut down when it is outside of the remote transmitters range.
• We recommend you operate your caddy within 20-30 yards for best control.
• For your protection the caddy has a 60 second timer. To prevent the caddy from stopping, create the habit of re-tapping your last command every 40 to 55 seconds. Any button press will restart the timer and prevent the caddy from stopping. (Generally just give the forward button a quick tap). If the remote is not pressed within 60 seconds it will stop. Simply press another button on the remote to restart.
QUICK TIP

*When first using your caddy, practice in a large open area. Take the time to practice the difference between a single touch of a key and a prolonged push especially with left and right functions. Also get comfortable with the coast and parking brake buttons. Practice turning the caddy perpendicular to hills when parking on an incline.*

PROGRAMMING THE GRI-1300/1350 LI CART

The caddy electronics may be customized for your personal preferences. All programing customization is done via the remote transmitter. Using “Program Mode” you can adjust the electronics to:

- Adjust Turning Force. Depending on your course, flatter golf courses require less turning force that hilly or undulated golf courses.
- Tracking issues. If a caddy veers off to one side. Read all tracking information under Precautions page 6 and Trouble Shooting page 19 before using electronic tracking adjustment.
- Reset Caddy back to original Factory Settings. This is useful if your caddy accidently gets programed or you program it and you do not like the new settings.

For the instructions below that say: “go into program mode”, follow these instructions:
On your remote transmitter, “Press the parking brake button.

Next press and quickly release the Coast/Program Button and then quickly press and hold the Coast/Program Button again.

While still holding the program button, within a few seconds the caddy will move forward at a slow speed.” If cart does not move, repeat. Your caddy is now in Program Mode.

1. **Store personal speeds on 1-4.**
   - (No need to go into program mode)
   - Using the forward and reverse arrow keys on the remote adjust caddy to your preferred walking pace.
   - Press and hold one of the speed control buttons 1-4 while caddy is traveling at your new desired speed.
   - Button is now set to new speed.

2. **Adjust turning force.** You can increase or decrease the speed at which the caddy turns.

   - **Go into Program Mode.**
   - Press the reverse button to stop the caddy.
   - To increase the turning power, press the forward button. To test the adjustment press the left or right turn buttons
   - To decrease the turning power, press the reverse button. Test as above.
   - To save your setting, press the Parking Brake Button.

3. **Adjust Tracking i.e. Caddy trails off to one side or the other on flat ground.**

   Electronically adjust tracking only after adjusting bag weight. (Instructions for front wheel axle adjustment are in the troubleshooting section, “*my caddy does not track in a straight line*” later in this manual).
• **Go into Program Mode.**
• To adjust the caddy to the left, press left button once. Or to adjust the caddy to the right press the right button once. Two button presses adjusts the tracking about one foot to either side in a 25-foot run.
• To save the setting, push the Parking Brake button.
• Test the caddy to see if you need further adjustment. Repeat as needed.

4. **Return all Programing back to Original Factory Settings.**

• **Go into Program Mode.**
• Press the reverse button to stop the caddy.
• Press 1,3,4,2 then the parking brake button. Your caddy should be at factory settings.

5. **Matching a “New Remote Transmitter” to your caddy.**
   Should you need to replace your remote transmitter, you will need to pair (match) it to the cart receiver. (NO need to go into program mode.)

   • With the caddy on (solid green LED), and the Remote Transmitter on, plug the USB cable into the USB port under the receiver dome. Plug the other end of the cable into the port on the remote transmitter.
   • The LED on your remote will slowly flash.
   • Press and hold the on/off button **on the caddy.** The remote transmitter LED will start rapid flashing.
• After a round of rapid flashing release the on/off button.
• Disconnect the USB cable and press the “Parking Brake” button on the remote.
• Press the On/Off button to get a solid green LED on caddy.
• Test all remote buttons.

TROUBLE SHOOTING GUIDE

My caddy will not show any indicator LED on the caddy handle.

1. Ensure Caddy Battery is plugged into the Caddy receptacle.
2. Have a full charge on Caddy Battery. After 3 - 5 hours for a lithium battery the charger LED will turn GREEN. After 6-8 hours on an SLA battery the charge light goes out.
3. Check the SLA battery terminal connections. Check both sides of ring terminals for corrosion; verify the connections are clean and tightly screwed into the battery tabs.
4. Check the fuse box on the SLA battery cable. This is inside of the battery bag, located on the positive (red) wire. Open the red fuse box and pull out the fuse. Check for burns or breaks. When they blow, they show a burned mark right in the middle of fuse (melted U shaped wire)
5. If problem persists, call Cart Tek for Technical Support.

My caddy will not show a solid green indicator LED on the caddy handle.

1. Make sure you can get a flashing green indicator LED first.
2. Press and hold the On/off button for 3 seconds
3. Check Gri-1300 battery terminal connections. Check sides of ring terminals for corrosion and verify that they are clean and tightly screwed to the battery.

My caddy is turned on (solid green LED), but my remote will not work.

1. Make sure the on/off switch is in the on position on the remote control transmitter.
2. Try restarting the caddy by disconnecting the battery for 5 seconds, then powering the caddy back on. Test remote again.
3. Ensure that the remote has a flashing red LED when pressing a function button. If not, replace batteries in remote.
4. Pair remote transmitter to caddy cart receiver by using the supplied USB cord. Follow the directions in the manual, or check our video
5. If problem persists, call Cart Tek for Technical Support.

My caddy Lithium Battery Charger isn't switching over from Orange to Green.

1. Verify Charger has green ready light before plugging in battery. If it does not call Cart Tek.
2. Ensure both the Caddy Battery and wall charger are fully plugged in.
3. If problems persist, call Cart Tek for Technical Support.

My caddy SLA Battery Charger isn't switching over from Red charge light to no light. Stays in charge mode.
1. Disconnect from charger and check battery to charger connection for contamination and tight fit
2. Check battery cable connections for contamination and secure connections. Clean and retighten as necessary.
3. Try Again. Do not leave on charger longer then 12 hours.
4. If battery is older than a year or has high use, you may need a new battery.
5. If problems persist, call Cart Tek for Technical Support

My caddy will not make 18 holes.

1. Verify that your charger is going into charge mode and then flipping over to green on a lithium or red Led is turning off on a GRI-1300 charger.
2. Check both sides of ring connections at the battery terminals on a GRI-1300 for corrosion and ensure that the connections are tight.

My caddy has erratic steering (i.e. Spins to the right/left, goes forward/backwards when pressing right/left).

1. Ensure both wheels are fully engaged into the drive collars located on the axles.
2. Check that drive collars are secured onto the axles. The drive collar is attached to the axle using a pin and a snap ring. Ensure both are intact. The drive collars should not move on the axel.
3. If problem persists, call Cart Tek for Technical Support or replacement parts.

My caddy does not track in a straight line.

1. Balance golf bag evenly on your caddy side to side.
2. Ensure both wheels are fully engaged into the drive collars located on the axles.
3. Check that the drive collars are secured onto the axles. The drive collar is attached to the axel by a pin and a snap ring. Ensure both are intact.
4. Reset your caddy to factory settings by following the instructions in the manual.
5. If caddy still does not go in a straight line, manually adjust tracking on the front wheel.
   • All caddy carts are tested to see how they track for straightness without a bag. First, double check how your caddy tracks without a bag. Use this as a guide for testing with the bag. If your caddy is going off track more than 3 feet within 20 yards, the easiest first thing to do is to check the weight distribution of your bag. How is it sitting on the caddy, is it sitting evenly with the weight evenly distributed between left and right sides? If the weight distribution does not solve your issue, you may need to fine tune the tracking by adjusting the front wheel axel.
   • If you caddy is going off track more than 3 feet within 20 yards adjust the axel in the front wheel.
   • To fine tune the front wheel axel is to move the front wheel axel very slightly. If caddy turns to the right, you will adjust the right side of front wheel axel forward and vice versa if the caddy tracks left.
   • "Loosen" the axel nut (A) on the side of the caddy that the caddy is curving into.
   • “Loosen” the axel nut (B) behind the wheel.
   • Adjust the tracking nut (C) backward (counter clockwise) to lengthen the axel, pushing the axel forward. TURN in quarter turn increments only. Test the tracking after each adjustment. It should only take 1 to 3 adjustments.
• Tighten nuts A and B back up.
My caddy stops unexpectedly during a round.

1. The carts are equipped with a 60 second timer that stops the caddy if you do not press additional buttons within that time period.
2. Check indicator LED's on caddy receiver dome.
   - No light – Make sure you're plug is connected to the caddy tray.
   - Flashing green – Press and hold the On/Off switch to power on the caddy. If caddy is stopping and has a flashing green LED, this would indicate a faulty battery cable. Contact Cart Tek.
   - Solid Red indicator LED means Low Battery.
   - Slow Flashing Red indicator LED means High Temperature, and you need to allow the caddy to cool down.
   - Rapid Flashing Red indicator LED means High Current Draw, This can be caused by too much weight on your caddy or trying to climb too steep of hill.
3. Ensure the AAA batteries in the transmitter are fresh.
4. Due to on board electronics, there might be environmental interferences causing your caddy to stop. These may include, but are not limited to: microwaves, cell towers, high voltage electrical power lines, et cetera. If the caddy always stops at the same place every time you play then it is likely environmental interference.

My Cart stopped while I am on the golf course.

1. If your caddy experiences some kind of failure on the course and you cannot get it running, you can put the caddy in “free wheel” mode.
2. Press the button on the inside wheel hub and pull wheels out of drive collar and lock wheels into groove on axel. Ensure that the wheel is locked onto the axel.

3. In free wheel mode you can pull the caddy backwards.

My caddy has stopped working and I cannot figure out what is wrong. Please call CartTek customer service and have the following information available:

1. When the caddy stopped working, what was the situation?

2. What color was the LED light on the receiver dome on the caddy? In bright sunshine you may have to cup your hands over the dome to see the light. This is critical information to the troubleshooting process. There are 5 options:
   a. Solid green
   b. Flashing green
   c. Solid Red
   d. Flashing Red
   e. No Light

3. The last time you charged your battery did you see the orange charging light? When the battery is on the charger now after the caddy stopped working, do you see the orange charging light?

4. Were you able to get the caddy to work again? If so what steps did you take?
