

## THE IMPLEMENT RANGE – LOGSPLITTERS

This 9 Tonne Hydraulic Vertical Logsplitter is suitable for splitting logs up to 0.6m in length. The vertical hydraulic ram has a working pressure of 9 tonnes and is fitted with an automatic reverse for safety. The machine will only work when the operator has both hands on the controls; this additional safety feature also allows the log to be moved and positioned with the control levers without the need to use hands near the area of operation.

An additional 4-way cutter can be fitted to the blade for double splitting for firewood.

A travel limit control on the ram can be set to return the splitter to the correct height for the length of the logs and thus reduce the time between each operation.

All splitters have their own hydraulic pumps and oil systems. Each unit has wheels, a removable work bench and retractable cutter for easy movement and storage.
