In 2010 I noticed that my right eye vision was changing. Initially, progress of the disease was slow, however after a few months, I noticed considerable loss in sharpness and progressive loss of vision. Vision was not only blurred but also I was visibly losing my eye sight.

Initially the problem was misdiagnosed to a “normal” aging process (I was 60 at that time) . As I do have only one eye this was a huge problem for me and I did not want to wait and slowly go blind. I was sent by my GP to Sydney Retina Clinic to obtain a second opinion. Dr A Chang, who runs the clinic, found out that I suffered from the wet form of Adult Macula Degeneration (AMD).

For over 6 months, my vision continued with good results however, on a cellular level it seemed to stop. Then Dr A Chang informed me about new studies into AMD and using common saffron in eye therapy.

Being a medico myself, I am a qualified veterinary surgeon, I delved into the details of this new, natural medication. Saffron had been observed to assist people with vision problems in certain parts of Italy. Certain correlation between saffron usage and vision improvement was observed which led to a clinical trial with very positive results.

Within 3 months of taking saffron, small changes on a cellular level were observed. It was very encouraging so I continued with saffron supplementation. After a few months certain “irreversible” changes in my retina started to dramatically improve.

In addition to saffron I also used bioactivated Resveratrol supplement, high in polyphenol antioxidants.

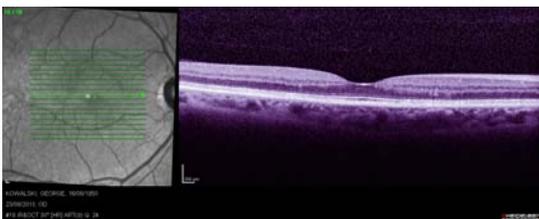

Today, after nearly 3 years of treatment with Lucentis and over 2 years of using saffron supplement my eye has returned to pre -AMD status with no visible changes on a cellular level.

My vision is 100% sharp and normal.

Throughout this period I was treated with Lucentis, initially every few weeks, with my own saffron supplementation. Today I need Lucentis injection every few months only. I still use saffron everyday.

Scan of my retina when AMD was diagnosed in Oct 2010

Recent scan of my retina in August 2013
