

Firmware v1.6 Release Notes

What's New in Firmware v1.6

Cedar Electronics is happy to announce the release of version 1.6 firmware. We continue to listen to what our customers have to say and have implemented several improvements with this newest release. For those of you wondering how we went from version 1.4 to version 1.6, that is because we had several changes in between for development purposes and testing. We are continuing to work on new improvements (for the Redline 360c and other models) such as arrow performance for a future release.

Enhancements

1. Improved radar detection response time. Response time improvements may vary on geographical and environmental conditions.
2. Improved accuracy and sensitivity for MRCD and MRCT.
3. Fixed an issue with missing text in Spanish Language, where preferences could hang up when using the K-Notch programming option.
4. Improved meter ramp-up linearity.
5. Improved arrow performance.
6. Improved strong signal handling capability.

How to Get the Update

If you are taking advantage of the Wi-Fi connection in your vehicle or have access to Wi-Fi, you will be prompted for the update once it becomes available. If you are not able to access Wi-Fi, you can connect your Redline 360c to your computer via USB (<https://www.escortradar.com/pages/update-your-device>). There are two different links on the page depending on if you are using Windows or Mac OS.

Keep the Feedback Coming

We want to keep hearing from you! If you have feedback or suggestions on how to make the Redline 360c even better, send an email to radarfeedback@cedarelectronics.com
